PREFACE

Although never a simple task, the study of the human body is always fascinating. Over the years, thousands of students have benefited in their studies and enjoyed the process of working through this book. The ninth edition of the *Anatomy & Physiology Coloring Workbook* continues to serve as a review and reinforcement tool to help health professional and life-science students master the basic concepts of human anatomy and physiology. Whether you are taking a 1- or 2-semester course, you will find this book invaluable to the study of anatomy and physiology.

Scope

Although this book reviews the human body from microscopic to macroscopic levels (that is, topics range from simple chemistry and cells to body organ systems), it is not intended to be encyclopedic. In fact, to facilitate learning, this workbook covers only the most important and useful aspects of human anatomy and physiology. Pathophysiology is briefly introduced with each system so that students can apply their learning. Where relevant, clinical aspects (for example, muscles used for injection sites, the role of ciliated cells in protection of the respiratory tract, and reasons for skin ulcer formation) are covered. To encourage a view of the human body as a dynamic and continually changing organism, developmental aspects of youth, adulthood, and old age are included.

Learning Aids

As in previous editions, multiple pedagogical devices are used throughout the book to test comprehension of key concepts. The integration of a traditional study guide approach with visualization and coloring exercises is unique. The variety of exercises demands learning on several levels, avoids rote memorization, and helps maintain a high level of interest.

The exercises include completion from a selection of key choices, matching terms or descriptions, and labeling diagrams. Elimination questions require the student to discover the similarities or dissimilarities among a number of structures or objects and to select the one that is not appropriate. Correctable true/false questions add a new dimension to the more traditional form of this exercise. Also, students are asked to provide important definitions. In the completion sections, the answer lines are long enough so that the student can write in either the key letter or the appropriate term. Both responses are provided in the answer section.

Coloring exercises are a proven motivating, effective approach to learning. Each illustration has been carefully prepared to show sufficient detail for learning without students becoming bored with coloring. There are more than 100 coloring exercises distributed throughout the text that should prove valuable to all students. The ninth edition features many new coloring exercises to ensure that

students gain practice with a wide range of structures. Students who are visually oriented will find these exercises particularly beneficial. When completed, the color diagrams provide an ideal reference and review tool.

Visualization exercises are a truly unique feature of this book. With the exception of the introductory chapter on terminology, each chapter contains an "Incredible Journey." Students are asked to imagine themselves in miniature, traveling within the body through various organs and systems. These visualization exercises are optional, but they often summarize chapter content, allowing students to assimilate what they have learned in unusual and amusing ways.

Thought-provoking "At the Clinic" questions challenge students to apply their newly acquired knowledge to clinical situations. Additionally, the ninth edition features a brand-new finale to each chapter with challenging multiple-choice questions.

Acknowledgments

To those educators, colleagues, and students who have provided feedback and suggestions during the preparation of all nine editions of this workbook, I am sincerely grateful. In particular, I want to thank the reviewers of the ninth edition for their valuable comments and suggestions: Lu Anne Clark, Lansing Community College; Catherine Elliott, Mount San Jacinto College; Judy Garrett, University of Arkansas Community College; Judy Megaw, Indian River Community College; Hal Nauman, Clatsop Community College; Lynn Rivers, Henry Ford Community College; Tina Ross, North Hennepin Community College; and Mary Weis, Collin County Community College District—Spring Creek Campus.

The staff at Benjamin Cummings has continuously supported my efforts to turn out a study tool that will be well received and beneficial to both educator and student audiences. For this edition, Deirdre Espinoza, Senior Acquisitions Editor, and Sabrina Larson, Project Editor, deserve special mention. I also wish to thank the entire team at Wendy Earl Productions and particularly David Novak for his diligent work as production editor on this edition.

INSTRUCTIONS FOR THE STUDENT—HOW TO USE THIS BOOK

Dear Student,

The Anatomy & Physiology Coloring Workbook has been created particularly for you. It is the outcome of years of personal attempts to find and create exercises helpful to my own students when they study and review for a lecture test or laboratory quiz.

I never cease to be amazed at how remarkable the human body is, but I would never try to convince you that studying it is easy. The study of human anatomy and physiology has its own special terminology. It requires that you become familiar with the basic concepts of chemistry to understand physiology, and often (sadly) it requires rote memorization of facts. It is my hope that this workbook will help simplify your task. To make the most of the exercises, read these instructions carefully before starting work.

Labeling and Coloring. Some of these questions ask you only to label a diagram, but most also ask that you do some coloring of the figure. You can usually choose whichever colors you prefer. Soft colored pencils are recommended so that the underlying diagram shows through. Most figures have several parts to color, so you will need a variety of colors—18 should be sufficient. In the coloring exercises, you are asked to choose a particular color for each structure to be colored. That color is then used to fill in both a color-coding circle found next to the name of the structure or organ, and the structure or organ on the figure. This allows you to identify the colored structure quickly and by name in cases where the diagram is not labeled. In a few cases you are given specific coloring instructions to follow.

Matching. Here you are asked to match a key term denoting a structure or physiologic process with a descriptive phrase or sentence. Because you must write the chosen term in the appropriate answer blank, the learning is more enduring.

Completion. You select the correct term to answer a specific question, or you fill in blanks to complete a sentence. In many exercises, some terms are used more than once and others are not used at all.

Definitions. You are asked to provide a brief definition of a particular structure or process.

True or False. One word or phrase is underlined in a sentence. You decide if the sentence is true as it is written. If not, you correct the underlined word or phrase.

Elimination. Here you are asked to find the term that does not "belong" in a particular grouping of related terms. In this type of exercise, you must analyze how the various terms are similar to or different from the others.

Visualization. The "Incredible Journey" is a special type of completion exercise, found in every chapter except the first one. For this exercise, you are asked to imagine that you have been miniaturized and injected into the body of a human being (your host). Anatomical landmarks and physiological events are described from your miniaturized viewpoint, and you are then asked to identify your observations. Although this exercise is optional, my students have found them fun to complete and I hope you will too.

At the Clinic. "At the Clinic" sections ask you to apply your newly acquired knowledge to clinical situations.

The Finale: Multiple Choice. The multiple choice questions test you from several vantage points and 1, 2, 3, or all of the answers may be correct—an approach that really tests your understanding of what you have studied.

Each exercise has complete instructions, which you should read carefully before beginning the exercise. When there are multiple instructions, complete them in the order given.

At times it may appear that information is duplicated in the different types of exercises. Although there is some overlap, the understandings being tested are different in the different exercises. Remember, when you understand a concept from several different perspectives, you have mastered that concept.

I sincerely hope that the *Anatomy & Physiology Coloring Workbook* challenges you to increase your knowledge, comprehension, retention, and appreciation of the structure and function of the human body.

Good luck!

THE HUMAN BODY: AN ORIENTATION

Most of us have a natural curiosity about our bodies, and a study of anatomy and physiology elaborates on this interest. Anatomists have developed a universally acceptable set of reference terms that allows body structures to be located and identified with a high degree of clarity. Initially, students might have difficulties with the language used to describe anatomy and physiology, but without such a special vocabulary, confusion is bound to occur.

The topics in this chapter enable students to test their mastery of terminology commonly used to describe the body and its various parts, and concepts concerning functions vital for life and homeostasis. Body organization from simple to complex levels and an introduction to the organ systems forming the body as a whole are also covered.

AN OVERVIEW OF ANATOMY AND PHYSIOLOGY

1. Match the terms in Column B to the appropriate descriptions provided in Column A. Enter the correct letter or its corresponding term in the answer blanks.

Column B Column A 1. The branch of biological science that A. Anatomy studies and describes how body parts B. Homeostasis work or function C. Metabolism 2. The study of the shape and structure of body parts D. Physiology 3. The tendency of the body's systems to maintain a relatively constant or balanced internal environment 4. The term that indicates all chemical reactions occurring in the body

- **2.** Circle all the terms or phrases that correctly relate to the study of *physiology*. Use a highlighter to identify those terms or phrases that pertain to the study of *anatomy*.
 - A. Measuring an organ's size, shape, and weight
- H. Dynamic
- B. Can be studied in dead specimens
- I. Dissection

C. Often studied in living subjects

J. Experimentation

D. Chemistry principles

- K. Observation
- E. Measuring the acid content of the stomach
- L. Directional terms

F. Principles of physics

M. Static

G. Observing a heart in action

LEVELS OF STRUCTURAL ORGANIZATION

3. The structures of the body are organized into successively larger and more complex structures. Fill in the answer blanks with the correct terms for these increasingly larger structures.

Chemicals — Organism

- 4. Circle the term that does not belong in each of the following groupings.
 - 1. Electron
- Cell
- Tissue
- Alive
- Organ

- 2. Brain
- Stomach
- Liver
- Epithelium

- 3. Epithelium
- Heart
- Heart

 Muscle tissue
- Nervous tissue
- Connective tissue

- 4. Human
- Digestive system
- Horse
- Pine tree
- Amoeba
- **5.** Using the key choices, identify the organ systems to which the following organs or functions belong. Insert the correct letter or term in the answer blanks.

Key Choices

- A. Cardiovascular
- D. Integumentary
- G. Nervous
- J. Skeletal

- B. Digestive
- E. Lymphatic/Immune
- H. Reproductive
- K. Urinary

- C. Endocrine
- F. Muscular
- I. Respiratory

1.	Rids the body of nitrogen-containing wastes
2.	Is affected by the removal of the thyroid gland
3.	Provides support and levers on which the muscular system can act
4.	Includes the heart
5.	Protects underlying organs from drying out and mechanical damage
6.	Protects the body; destroys bacteria and tumor cells
7.	Breaks down foodstuffs into small particles that can be absorbed
8.	Removes carbon dioxide from the blood
9.	Delivers oxygen and nutrients to the body tissues
10.	Moves the limbs; allows facial expression
11.	Conserves body water or eliminates excesses
12.	Provides for conception and childbearing
13.	Controls the body with chemicals called hormones
14.	Is damaged when you cut your finger or get a severe sunburn
Using the key choices from each of the following sets of term in the answer blanks.	Exercise 5, choose the organ system to which organs belongs. Enter the correct letter or
1.	Blood vessels, heart
2.	Pancreas, pituitary, adrenal glands
3.	Kidneys, bladder, ureters
4.	Testis, vas deferens, urethra
5.	Esophagus, large intestine, rectum
6.	Breastbone, vertebral column, skull
7	Brain, nerves, sensory receptors

7. Figures 1–1 to 1–6, on pages 4–6, represent the various body organ systems. First identify and name each organ system by labeling the organ system under each illustration. Then select a different color for each organ and use it to color the coding circles and corresponding structures in the illustrations.

20. A jogger has stepped in a pothole and sprained his ankle. What systems have suffered damage?

- **21.** A newborn baby is unable to hold down any milk. Examination reveals a developmental disorder in which the esophagus fails to connect to the stomach. What survival needs are most immediately threatened?
- **22.** The Chan family was traveling in their van and had a minor accident. The children in the backseat were wearing lap belts, but they still sustained bruises around the abdomen and had some internal organ injuries. Why is this area more vulnerable to damage than others?
- 23. John, a patient at Jones City Hospital, is in tough shape. He has a hernia in his inguinal region, pain from an infected kidney in his lumbar region, and severe bruises and swelling in his pubic region. Explain where each of these regions is located.
- **24.** The hormone thyroxine is released in response to a pituitary hormone called TSH. As thyroxine levels increase in the blood, they exert negative feedback on the release of TSH by the pituitary gland. What effect will this have on the release of TSH?
- **25.** In congestive heart failure, the weakened heart is unable to pump with sufficient strength to empty its own chambers. As a result, blood backs up in the veins, blood pressure rises, and circulation is impaired. Describe what will happen as this situation worsens owing to positive feedback. Then, predict how a heart-strengthening medication will reverse the positive feedback.

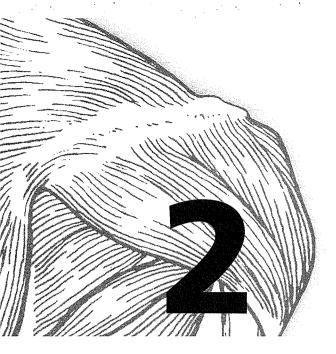

- **26.** The following advanced imaging techniques are discussed in the text: CT, DSA, PET, ultrasound, and MRI. Which of these techniques uses X rays? Which uses radio waves and magnetic fields? Which uses radioisotopes? Which displays body regions in sections? (You may have more than one answer for each question.)
- **27.** A patient reports stabbing pains in the right hypochondriac region. The medical staff suspects gallstones. What region of the body will be examined?

- 28. Select the best answer or answers from the choices given.
 - 1. Which of the following activities would not represent an anatomical study?
 - A. Making a section through the heart to observe its interior
 - B. Drawing blood from recently fed laboratory animals at timed intervals to determine their blood sugar levels
 - C. Examining the surface of a bone
 - D. Viewing muscle tissue through a microscope
 - 2. Which of the following is (are) involved in maintaining homeostasis?
 - A. Effector
- D. Feedback
- B. Control center
- E. Lack of change
- C. Receptor

- 3. When a capillary is damaged, a platelet plug is formed. The process involves platelets sticking to each other. The more platelets that stick together, the more the plug attracts additional platelets. This is an example of:
 - A. negative feedback
 - B. positive feedback
- 4. A coronal plane through the head:
 - A. could pass through both the nose and the occiput
 - B. could pass through both ears
 - C. must pass through the mouth
 - D. could lie in a horizontal plane

- 5. Which of the following statements is correct?
 - A. The brachium is proximal to the antebrachium.
 - B. The femoral region is superior to the tarsal region.
 - C. The orbital region is inferior to the buccal region.
 - D. The axillary region is lateral to the sternal region.
 - E. The crural region is posterior to the sural region.
- 6. Which of the following body regions is (are) found on the torso?
 - A. Gluteal
- D. Acromial
- B. Inguinal
- E. Olecranal
- C. Popliteal
- 7. A neurosurgeon orders a spinal tap for a patient. Into what body cavity will the needle be inserted?
 - A. Ventral
- D. Cranial
- B. Thoracic
- E. Pelvic
- C. Dorsal
- 8. An accident victim has a collapsed lung. Which cavity has been entered?
 - A. Mediastinal
- D. Vertebral
- B. Pericardial
- E. Ventral
- C. Pleural
- 9. Which body system would be affected by degenerative cartilage?
 - A. Muscular
- D. Skeletal
- B. Nervous
- E. Lymphatic
- C. Cardiovascular

- 10. The position of the heart relative to the structures around it would be described accurately as:
 - A. deep to the sternum (breastbone)
 - B. lateral to the lungs
 - C. superior to the diaphragm
 - D. inferior to the ribs
 - E. anterior to the vertebral column
- 11. What term(s) could be used to describe the position of the nose?
 - A. Intermediate to the eyes
 - B. Inferior to the brain
 - C. Superior to the mouth
 - D. Medial to the ears
 - E. Anterior to the ears
- 12. The radiographic technique used to provide information about blood flow is:
 - A. DSR
- D. ultrasonography
- B. CT
- E. any X-ray technique
- C. PET
- 13. A patient complains of pain in the lower right quadrant. Which system is most likely to be involved?
 - A. Respiratory
- D. Skeletal
- B. Digestive
- E. Muscular
- C. Urinary

BASIC CHEMISTRY

Everything in the universe is composed of one or more elements, the unique building blocks of all matter. Although over 100 elemental substances exist, only four of these (carbon, hydrogen, oxygen, and nitrogen) make up more than 96% of all living material.

The student activities in this chapter consider basic concepts of both inorganic and organic chemistry. Chemistry is the science that studies the composition of matter. Inorganic chemistry studies the chemical composition of nonliving substances that (generally) do not contain carbon. Organic chemistry studies the carbon-based chemistry (or biochemistry) of living organisms, whether they are maple trees, fish, or humans.

Understanding of atomic structure, bonding behavior of elements, and the structure and activities of the most abundant biologic molecules (proteins, fats, carbohydrates, and nucleic acids) is tested in various ways. Mastering these concepts is necessary to understand how the body functions.

1. Select all phrases that apply to each of the following statements and insert

CONCEPTS OF MATTER AND ENERGY

the letters in the answer blanks.

	. The energy loca	ted in the bonds of food m	olecul	es:
	A. is called then			causes molecular movemen
	B. is a form of 1	· ·		can be transformed to the bonds of ATP
	. Heat is:			
	A. thermal energ	gy	C.	kinetic energy
	B. infrared radia	ition	D.	molecular movement
4474	. Whenever energ	gy is transformed:		
	A. the amount of	of useful energy decreases	C.	some energy is created
	B. some energy	is lost as heat	D.	some energy is destroyed

Use choices from the key to identify the energy <i>form</i> in use in each of the following examples.						
Key Choices						
A. Chemical	B. Electrical	C. Mechanical	D. Radiant			
	1. Chewing f	food				
	2. Vision (tw	o types, please—think!)				
3. Bending your fingers to make a fist						
	_	the bonds of ATP molectake that fist	ules to energize your muscle			
	5. Lying und	er a sunlamp				
Complete the follo		ng the missing words.				
Particle	Location	Electrical ch	arge Mass			
		+ 1				
Neutron						
	Orbitals					
for each of the fol 1. Oxygen	lowing elements 4. Iodine		10. Magnesium			
2. Carbon	, ,		11. Chlorine			
3. Potassiu	m 6. Nitroge	en 9. Phospho	rus 12. Iron			
Using the key choices, select the correct responses to the following descriptive statements. Insert the appropriate answers in the answer blanks.						
Key Choices						
A. Atom	C. Element E. Ion	G. Molecule	I. Protons			
B. Electrons	D. Energy F. Matt	er H. Neutrons	J. Valence			
	1. An electric	cally charged atom or gre	oup of atoms			
	2. Anything t	that takes up space and	has mass (weight)			

	3. A unique substance composed of atoms having the same atomic number	
	4. Negatively charged particles, forming part of an atom	
	5. Subatomic particles that determine an atom's chemical behavior, or bonding ability	
	6. The ability to do work	
	7. The smallest particle of an element that retains the properties of the element	
	8. The smallest particle of a compound, formed when atoms combine chemically	
	9. Positively charged particles forming part of an atom	
	10. Name given to the electron shell that contains the most reactive electrons	
	1112. Subatomic particles responsible for most of an atom's mass

blank. If any of th	 statements are false, correct the <u>underlined</u> term by rection in the answer blank. 1. Na⁺ and K⁺ are <u>needed</u> for nerve cells to conduct electrical impulses. 2. The atomic number of oxygen is 8. Therefore, oxygen atoms always contain 8 <u>neutrons</u>. 3. The greater the distance of an electron from the nucleus, the <u>less</u> energy it has. 4. Electrons are located in more or less designated areas of space around the nucleus called <u>orbitals</u>. 5. An unstable atom that decomposes and emits energy is called <u>retroactive</u>. 6. <u>Iron</u> is necessary for oxygen transport in red blood cells. 	

MOLECULES, CHEMICAL BONDS, AND CHEMICAL REACTIONS

7. Match the terms in Column B to the chemical equations listed in Column A. Enter the correct letter or term in the answer blanks.

Column A	Column B
 _ 1. A + B → AB	A. Decomposition
_ 2. AB + CD → AD + CB	B. Exchange
_ 3. XY → X + Y	C. Synthesis

- **8.** Figure 2–1 is a diagram of an atom. Select two different colors and use them to color the coding circles and corresponding structures on the figure. Complete this exercise by responding to the questions that follow, referring to the atom in this figure. Insert your answers in the answer blanks provided.
 - Nucleus
 - () Electrons

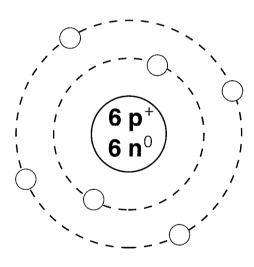

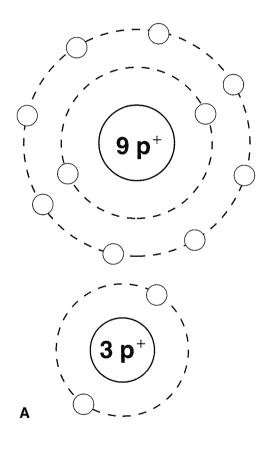

Figure 2-1

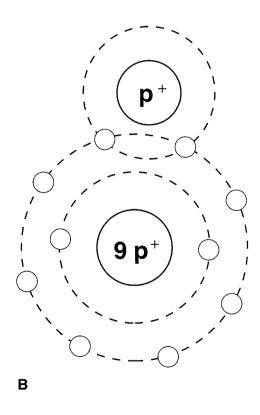

- 6. How many electrons would be needed to fill its outer (valence) shell?

covalent bonds?	Why?
	mical species with two hydrogen atoms and blain how these species are different:

10. Two types of chemical bonding are shown in Figure 2–2. In the figure, identify each type as a(n) *ionic* or *covalent* bond. In the case of the ionic bond, indicate which atom has lost an electron by adding a colored arrow to show the direction of electron transfer. For the covalent bond, indicate the shared electrons.

Type of bond:

Type of bond: _____

Figure 2-2

11. Figure 2–3 illustrates five water molecules held together by hydrogen bonds. First, correctly identify the oxygen and hydrogen atoms both by color and by inserting their atomic symbols on the appropriate circles (atoms). Then label the following structures in the figure:

Oxygen

- O Positive pole (end)
- Negative pole (end)
- Hydrogen bonds

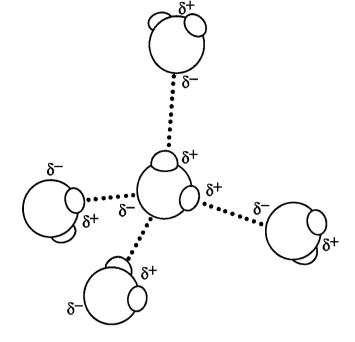

Figure 2-3

12. Circle each structural formula that is *likely* to be a polar covalent compound.

CI I A CI-C-CI

B H-C

c N

D CI - C

E /O

13. Respond to the instructions following the equation:

$$H_2CO_3 \longrightarrow H^+ + HCO_3^-$$

- 1. In the space provided, list the chemical formula(s) of compounds.
- 2. In the space provided, list the chemical formula(s) of ions.
- 3. Circle the product(s) of the reaction.
- 4. Modify the equation by adding a colored arrow in the proper place to indicate that the reaction is reversible.

BIOCHEMISTRY: THE COMPOSITION OF LIVING MATTER

14. Use the key choices to identify the substances described in the following statements. Insert the appropriate letter(s) or corresponding term(s) in the answer blanks.

Key Choices	:			
A. Acid(s)	B. Base(s)	C. Buffer	D. Salt(s)	
1	2	3. Sub	stances that ionize in	water; good electrolytes
	4. P	roton (H+) accep	otor	
		onize in water to ther than hydrox		ns and a negative ion
	6. Io	onize in water to	release ions other th	nan H+ and OH-
	7. F	ormed when an	acid and a base are	combined
	8. S	ubstances such a	s lemon juice and vi	negar
	9. P	revents rapid/lar	ge swings in pH	
	1. 2. 3. 4. 5. 6.	ture and thus (1) Bioche About (3) 9 molecules are the presence essential in bi reactions. Bec	prevent sudden char emical reactions in the % of the volume of a bonded to other wa of <u>(4)</u> bonds. Wat ochemical reactions	relatively constant temperanges is because of its high be body must occur in(2) living cell is water. Water atter molecules because of ter, as H ⁺ and OH ⁻ ions, is such as(5)_ and(6)_ rater is an excellent solven other body(8)
	7.			
	8.			
6. Use an <i>X</i> to	designate which o	of the following :	are organic compoun	nds.
Carb	oon dioxide	Fats	Proteins	H ₂ O
Oxy	gen	KCl	Glucose	DNA

17. Using the key choices, fully characterize weak and strong acids.

Key Choices	
-------------	--

A. Ionize completely in water	E. Ionize at high pH
B. Ionize incompletely in water	F. Ionize at low pH
C. Act as part of a buffer system	G. Ionize at pH 7

D. When placed in water, always act to change the pH

Weak acid:	Strong acid:	
Wear acid.	outong acid.	

18. Match the terms in Column B to the descriptions provided in Column A. Enter the correct letter(s) or term(s) in the answer blanks.

C	olumn A	Column B
1.	Building blocks of carbohydrates	A. Amino acids
2.	Building blocks of fat	B. Carbohydrates
3.	Building blocks of protein	C. Lipids (fats)
4.	Building blocks of nucleic acids	D. Fatty acids
5.	Cellular cytoplasm is primarily composed of this substance	E. Glycerol
6.	The single most important fuel source	F. Nucleotides
	for body cells	G. Monosaccharides
7 <i>.</i>	Not soluble in water	H. Proteins
8.	Contain C, H, and O in the ratio CH ₂ O	
9.	Contain C, H, and O, but have relatively sm	all amounts of oxygen
10.	11. These building in addition to 0	
12.	Contain P in addition to C, H, O, and N	
13.	Used to insulate the body and found in all of	cell membranes
14.	Primary components of meat and cheese	
15.	Primary components of bread and lollipops	
16.	Primary components of egg yolk and peanu	t oil
17.	Include collagen and hemoglobin	
10	Class that usually includes chalestoral	

19. Using the key choices, correctly select *all* terms that correspond to the following descriptions. Insert the correct letter(s) or their corresponding term(s) in the answer blanks.

Key Choices

- A. Cholesterol
- D. Enzyme
- G. Hormones
- J. Maltose

- B. Collagen
- E. Glycogen
- H. Keratin
- K. RNA

- C. DNA
- F. Hemoglobin
- I. Lactose
- L. Starch
- 1. Example(s) of fibrous (structural) proteins
 - $2. \ Example(s) \ of \ globular \ (functional) \ proteins$
 - _____ 3. Biologic catalyst
 - ____ 4. Plant storage carbohydrate
 - _____ 5. Animal storage carbohydrate
 - _____ 6. The "stuff" of the genes
 - _____ 7. A steroid
 - _____ 8. Double sugars, or disaccharides
- **20.** Five simplified diagrams of biological molecules are depicted in Figure 2–4. First, identify the molecules and insert the correct names in the answer blanks on the figure. Then select a different color for each molecule listed below and use them to color the coding circles and the corresponding molecules on the illustration.
 - O Fat

- Nucleotide
-) Monosaccharide

- Functional protein
- () Polysaccharide

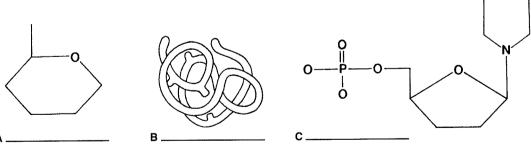

Figure 2-4

41	. Chicle the term	mai does not ber	ong in each of the	: ronowing group	ings.				
	1. Adenine	Guanine	Glucose	Thymine					
	2. DNA	Ribose	Phosphate	Deoxyribose					
	3. Galactose	Glycogen	Fructose	Glucose					
	4. Amino acid	Polypept	ide Glyce	erol Prot	ein				
	5. Glucose	Sucrose	Lactose	Maltose					
22.	For each true st rect the <u>underli</u>	atement, insert <i>T</i> ned term and inse	in the answer bla	nk. If any are fal in the answer bl	se, cor- ank.				
		1. Pho	spholipids are <u>po</u>	arized molecules					
		2. <u>Ster</u>	oids are the major	form in which b	ody fat is stored.				
		3. <u>Wat</u>	er is the most abu	ndant compound	in the body.				
		4. <u>Nor</u>	<u>polar</u> molecules a	re generally solu	ole in water.				
		5. The	bases of RNA are	A, G, C, and <u>U</u> .					
		6. The	universal energy	currency of living	cells is <u>RNA</u> .				
	7. RNA is <u>single</u> stranded.								
			four elements thater are C, H, N, an	_	than 90% of living				
23.	Figure 2–5 show	s the molecular s	tructure of DNA,	a nucleic acid.					
	A. First, identify the two unnamed nitrogen (N) bases and insert their correct names and symbols in the two blanks beside the color-coding circles.								
	B. Complete the symbols in the	identification of t e appropriate spa	he bases on the c	liagram by inserti de of the diagran	ng the correct n.				
	C. Select differer of the diagran	nt colors and colo n.	r the coding circle	es and the corresp	oonding parts				
	D. Label one dec of the DNA st	oxyribose (d-R) su tructure by inserti	gar unit and one ng leader lines an	phosphate (P) ur d labels on the d	ait of the "backbones"				
	E. Circle the asso	ociated nucleotide).						
	O Deoxyribose	sugar (d-R)	Adenine (A)	()				
	Phosphate (I	?)	Cytosine (C) <u> </u>	()				
	Then answer the	questions follow	ing Figure 2–5 by	writing your ans	wers in the answer blanks				

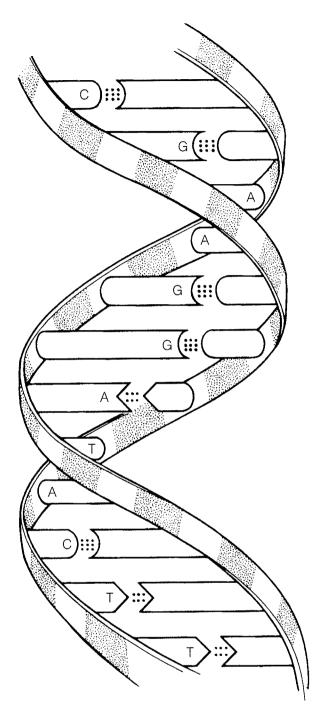

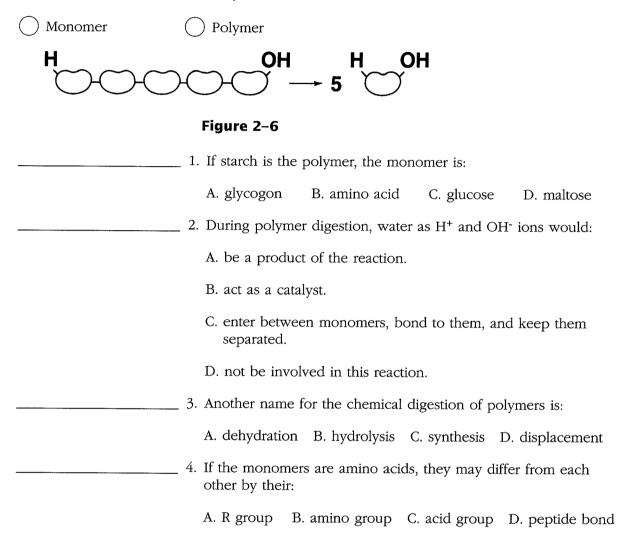

Figure 2-5

- 1. Name the bonds that help to hold the two DNA strands together.
- 2. Name the three-dimensional shape of the DNA molecule.
- 3. How many base pairs are present in this segment of a DNA model? _____
- 4. What is the term that means "base pairing"?

24. The biochemical reaction shown in Figure 2–6 represents the complete digestion of a polymer (a large molecule as consumed in food) down to its constituent monomers, or building blocks. Select two colors and color the coding circles and the structures. Then, select the one correct answer for each statement below and insert your answer in the answer blank.

A Visualization Exercise for Biochemistry

... you are suddenly upended and are carried along in a sea of water molecules at almost unbelievable speed.

25. Complete the narrative by inserting the missing words in the answer blanks.

For this journey, you are miniaturized to the size of a very small molecule by colleagues who will remain in contact with you by radio. Your instructions are to play the role of a water molecule and to record any reactions that involve water molecules. Considering water molecules are polar

12.	molecules, you are outfitted with an insulated rubber wet suit with one <u>(1)</u> charge at your helmet and two <u>(2)</u> charges, one at the end of each leg.
	As soon as you are injected into your host's bloodstream, you feel as though you are being pulled apart. Some large, attractive forces are pulling at your legs from different directions! You look about but can see only water molecules. After a moment's thought, you remember the polar nature of your wet suit. You record that these forces must be the(3)_ that are easily formed and easily broken in water.
	After this initial surprise, you are suddenly upended and carried along in a sea of water molecules at almost unbelievable speed. You have just begun to observe some huge, red, disk-shaped structures (probably(4)_) taking up O ₂ molecules when you are swept into a very turbulent environment. Your colleagues radio that you are in the small intestine. With difficulty, because of numerous collisions with other molecules, you begin to record the various types of molecules you see.
	In particular, you notice a very long helical molecule made of units with distinctive R-groups. You identify and record this type of molecule as a(5)_, made of units called(6) that are joined together by(7) bonds. As you move too close to the helix during your observations, you are nearly pulled apart to form two ions,(8)_, but you breathe a sigh of relief as two ions of another water molecule take your place. You watch as these two ions move between two units of the long

helical molecule. Then, in a fraction of a second, the bond between the two units is broken. As you record the occurrence of this chemical reaction, called __(9)_, you are jolted into another direction by an enormous globular protein, the very same __(10)_ that controls and speeds up this chemical reaction.

Once again you find yourself in the bloodstream, heading into an organ identified by your colleagues as the liver. Inside a liver cell, you observe many small monomers, made up only of C, H, and O atoms. You identify these units as __(11)_ molecules because the liver cells are bonding them together to form very long, branched polymers called __(12)_. You record that this type of chemical reaction is called __(13)_, and you happily note that this reaction also produces __(14)_ molecules like you!

After another speedy journey through the bloodstream, you reach the skin. You move deep into the skin and finally gain access to a sweat gland. In the sweat gland, you collide with millions of water molecules and some ionized salt molecules that are continually attracted to your positive and negative charges. Suddenly, the internal temperature rises, and molecular collisions (15) at an alarming rate, propelling you through the pore of the sweat gland onto the surface of the skin. So that you will be saved from the fate of evaporating into thin air, you contact your colleagues and are speedily rescued.

- **26.** It is determined that a patient is in acidosis. What does this mean, and would you treat the condition with a chemical that would *raise* or *lower* the pH?
- **27.** A newborn is diagnosed with sickle cell anemia, a genetic disease in which substitution of one amino acid results in abnormal hemoglobin. Explain to the parents how the substitution can have such a drastic effect on the structure of the protein.
- **28.** Johnny's body temperature is spiking upward. When it reaches 104°F, his mother puts in a call to the pediatrician. She is advised to give Johnny children's acetaminophen or ibuprofen and sponge his body with cool to tepid water to prevent a further rise in temperature. How might a fever (excessively high body temperature) be detrimental to Johnny's welfare?
- **29.** Mrs. Gallo's physician suspects that she is showing the initial signs of multiple sclerosis, a disease characterized by the formation of hardened plaques in the insulating sheaths surrounding nerve fibers. What medical imaging technique will the physician probably order to determine if such plaques are present?
- **30.** Stanley has indigestion and is doubled over with pain. How could an antacid reduce his stomach discomfort?
- **31.** Explain why the formation of ATP from ADP and P_i requires more energy than the amount released for cellular use when ATP is broken down.

THE FINALE: MULTIPLE CHOICE

- 32. Select the best answer or answers from the choices given.
 - 1. Which of the following is (are) true concerning the atomic nucleus?
 - A. Contains the mass of the atom
 - B. The negatively charged particles are here
 - C. Particles can be ejected
 - D. Contains particles that determine atomic number
 - E. Contains particles that interact with other atoms
 - 2. Organic compounds include:
 - A. water
- D. carbonic acid
- B. carbon dioxide
- E. glycerol
- C. oxygen
- 3. Important functions of water include:
 - A. cushioning
 - B. transport medium
 - C. participation in chemical reactions
 - D. solvent for sugars, salts, and other solutes
 - E. reducing temperature fluctuations
- 4. Which of the elements listed is the most abundant extracellular anion?
 - A. Phosphorus
- D. Chloride
- B. Sulfur
- E. Calcium
- C. Potassium
- 5. The element essential for normal thyroid function is:
 - A. iodine
- D. selenium
- B. iron
- E. zinc
- C. copper

- 6. Alkaline substances include:
 - A. gastric juice
- D. orange juice
- B. water
- E. ammonia
- C. blood
- 7. Which of the following is (are) not a monosaccharide?
 - A. Glucose
- D. Glycogen
- B. Fructose
- E. Deoxyribose
- C. Sucrose
- 8. Which is a building block of neutral fats?
 - A. Ribose
- D. Glycine
- B. Guanine
- E. Glucose
- C. Glycerol
- 9. Which of the following is primarily responsible for the helical structure of a polypeptide
 - A. Hydrogen bonding
 - B. Tertiary folding
 - C. Peptide bonding
 - D. Quaternary associations
 - E. Complementary base pairing
- 10. Which of the following is (are) not true of RNA?
 - A. Double-stranded
 - B. Contains cytosine
 - C. Directs protein synthesis
 - D. Found primarily in the nucleus
 - E. Can act as an enzyme
- 11. DNA:
 - A. contains uracil
- C. is the "genes"
- B. is a helix
- D. contains ribose

- 12. Glucose is to starch as:
 - A. a steroid is to a lipid
 - B. a nucleotide is to nucleic acid
 - C. an amino acid is to a protein
 - D. a polypeptide is to an amino acid
- 13. Energy contained in molecular bonds is:
 - A. electrical
- D. radiant
- B. mechanical
- E. kinetic
- C. chemical

CELLS AND TISSUES

The basic unit of structure and function in the human body is the cell. Each of a cell's parts, or organelles, as well as the entire cell, is organized to perform a specific function. Cells have the ability to metabolize, grow and reproduce, move, and respond to stimuli. The cells of the body differ in shape, size, and in specific roles in the body. Cells that are similar in structure and function form tissues, which, in turn, construct the various body organs.

Student activities in this chapter include questions relating to the structure and function of the generalized animal cell and to the general arrangement of tissues and their contribution to the activities of the various body organs.

1. Answer the following questions by inserting your responses in the

CELLS

Overview

answer blanks.			
	_ 1.	1–4.	Name the four elements that make up the bulk of living matter.
	_ 2. _ 3.	5.	Name the single most abundant material or substance in living matter.
	_ 4.	6.	Name the trace element most important for making bones hard.
	_ 5. _ 6.	7.	Name the element, found in small amounts in the body, that is needed to make hemoglobin for oxygen transport.
	_ 7. _ 8.	8–12.	Although there are many specific "jobs" that certain cells are able to do, name five functions common to all cells.
	_ 9.		11.
	10		12

13.	13–15.	List three different cell shapes.
14.	16.	Name the fluid, similar to seawater, that surrounds and bathes all body cells.
15.	17	Name the flattened cells, important in protection, that
16.	1,,	fit together like tiles. (This is just one example of the generalization that a cell's structure is very closely
17.		related to its function in the body.)

Anatomy of a Generalized Cell

2. Using the list of terms on the following page, correctly label all cell parts indicated by leader lines in Figure 3–1. Then select different colors for each structure and use them to color the coding circles and the corresponding structures in the illustration.

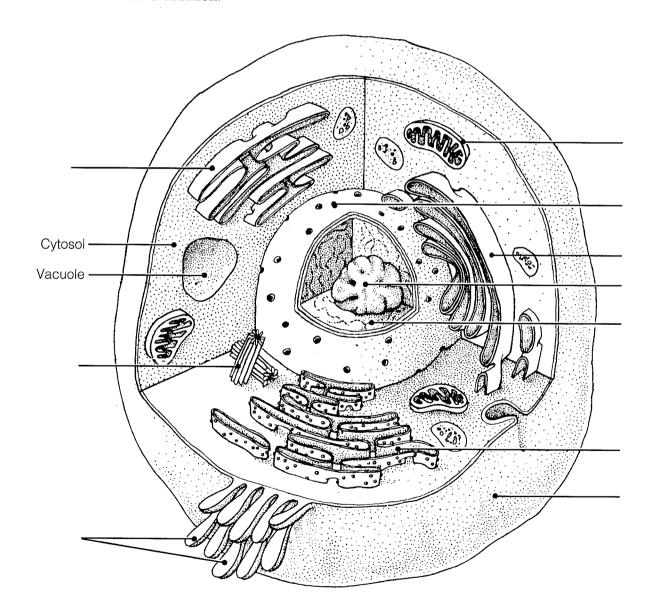

Figure 3-1

Plasma membrane	Mitochondrion

5. Relative to cellular organelles, circle the term or phrase that does not belong

Cell Physiology

Membrane Transport

8. Figure 3–4 shows a semipermeable sac, containing 4% NaCl, 9% glucose, and 10% albumin, suspended in a solution with the following composition: 10% NaCl, 10% glucose, and 40% albumin. Assume the sac is permeable to all substances *except* albumin. Using the key choices, insert the letter indicating the correct event in the answer blanks.

Key Choices		
A. Moves into the sac	B. Moves out of the sac	C. Does not move
	1. Glucose	3. Albumin
	2. Water	4. NaCl

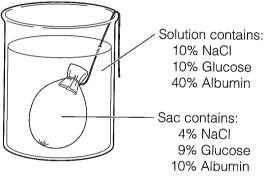

Figure 3-4

9. Figure 3–5 shows three microscopic fields (A–C) containing red blood cells. Arrows indicate the direction of net osmosis. Respond to the following questions, referring to Figure 3–5, by inserting your responses in the spaces provided.

1.	Which microscopic field contains a hypertonic solution?
	The cells in this field are said to be
2.	Which microscopic field contains an isotonic bathing solution?
	What does isotonic mean?
3.	Which microscopic field contains a hypotonic solution?
	What is happening to the cells in this field and why?

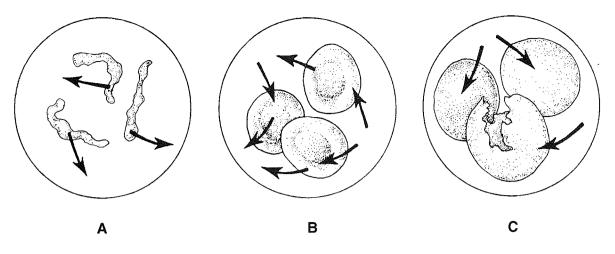

Figure 3-5

- **10.** Figure 3–6 is a simplified diagram of the plasma membrane. Structure A represents channel proteins constructing a pore, structure B represents an ATP-energized solute pump, and structure C is a transport protein that does not depend on energy from ATP. Identify these structures and the membrane phospholipids by color before continuing.
 - Passive transport protein carrier Phospholipids Channel Solute pump O_2 Fat Amino acid Na+ Glucose **Steroid** H_20 Cell CO2 CIexterior A 02 Na+ K+ Amino acid Cell

Figure 3-6

Glucose

Now add arrows to Figure 3–6 as instructed next: For each substance that moves through the plasma membrane, draw an arrow indicating its (most likely) direction of movement (into or out of the cell). If it is moved actively, use a red arrow; if it is moved passively, use a blue arrow.

CO2

interior

40 Anatomy & Physiology Coloring Workbook

Finally, answer the following questions referring to Figure 3-6: 1. Which of the substances shown moves passively through the lipid part of the membrane? 2. Which of the substances shown enters the cell by attachment to a passivetransport protein carrier? 3. Which of the substances shown moves passively through the membrane by moving through its pores? 4. Which of the substances shown would have to use a solute pump to be transported through the membrane? 11. Select the key choices that characterize each of the following statements. Insert the appropriate answers in the answer blanks. Key Choices A. Active transport D. Exocytosis G. Phagocytosis B. Diffusion, simple E. Facilitated diffusion H. Pinocytosis C. Diffusion, osmosis F. Filtration I. Receptor-mediated endocytosis 1. Engulfment processes that require ATP _____ 2. Driven by molecular energy ______ 3. Driven by hydrostatic (fluid) pressure (typically blood pressure in the body) 4. Moves down a concentration gradient ______ 5. Moves up (against) a concentration gradient; requires a carrier 6. Moves small or lipid-soluble solutes through the membrane 7. Transports amino acids and Na⁺ through the plasma membrane ______ 8. Examples of vesicular transport 9. A means of bringing fairly large particles into the cell _____10. Used to eject wastes and to secrete cell products _____11. Membrane transport using channels or carrier proteins that does not require ATP

Cell Division

12. The following statements provide an overview of the structure of DNA (genetic material) and its role in the body. Choose responses from the key choices that complete the statements. Insert the appropriate answers in the answer blanks.

Key Choices

A. Adenine	G. Enzymes	M. Nucleotides	S. Ribosome			
B. Amino acids	H. Genes	N. Old	T. Sugar (deoxyribose)			
C. Bases	I. Growth	O. Phosphate	U. Template, or model			
D. Codons	J. Guanine	P. Proteins	V. Thymine			
E. Complementary	K. Helix	Q. Replication	W. Transcription			
F. Cytosine	L. New	R. Repair	X. Uracil			
	(1) In a the like a spiral start parts of I cules, forming information of nitrogen-contain the "rungs" of combined in different(6) N-containing by certain bases of the interval of the containing by certain bases of the containing by the	DNA molecules contain information for building specific (1). In a three-dimensional view, a DNA molecule looks like a spiral staircase; this is correctly called a (2). The constant parts of DNA molecules are the (3) and (4) molecules, forming the DNA-ladder uprights, or backbones. The information of DNA is actually coded in the sequence of nitrogen-containing (5), which are bound together to form the "rungs" of the DNA ladder. When the four DNA bases are combined in different three-base sequences, called triplets, different (6) of the protein are called for. It is said that the N-containing bases of DNA are (7), which means that only certain bases can fit or interact together. Specifically, this means that (8) can bind with guanine, and adenine binds with (9).				
	and RNA. RNA "molecular slav carries out the protein on a c cell is preparir have all its info 13. so that a "doul For DNA synth 14. bonds between single strands of a whole DN cule formed is replicates before has a complete	ne production of proteins involves the cooperation of DN ad RNA. RNA is another type of nucleic acid that serves a nolecular slave" to DNA. That is, it leaves the nucleus an arries out the instructions of the DNA for the building of otein on a cytoplasmic structure called a(10) When all is preparing to divide, in order for its daughter cells to that a "double dose" of genes is present for a brief per or DNA synthesis to occur, the DNA must uncoil, and the onds between the N bases must be broken. Then the two negle strands of(12)_ each act as a(13)_ for the building a whole DNA molecule. When completed, each DNA nulle formed is half(14)_ and half(15) The fact that Displicates before a cell divides ensures that each daughter is a complete set of(16) Cell division, which then for two, provides new cells so that(17)_ and(18)_ can occur.				

i. Identify the phases of mitosis depicted in Figure 3–7 by inserting the correct name in the blank under the appropriate diagram. Then select different colors to represent the structures listed below and use them to color in the coding circles and the corresponding structures in the illustration.				
Nuclear membrane(s), if present	Centrioles			
Nucleoli, if present	Spindle fibers			
Chromosomes				
A				

Figure 3-7

14. The following statements describe events that occur during the different phases of mitosis. Identify the phase by choosing the correct response(s) from the key choices and inserting the letter(s) or term(s) in the answer blanks.

Key Choices	
A. Anaphase	C. Prophase E. None of these
B. Metaphase	D. Telophase
	1. Chromatin coils and condenses to form deeply staining bodies.
	2. Centromeres break, and chromosomes begin migration toward opposite poles of the cell.
	3. The nuclear membrane and nucleoli reappear.
	4. When chromosomes cease their poleward movement, this phase begins.
	5. Chromosomes align on the equator of the spindle.
	6. The nucleoli and nuclear membrane disappear.
	7. The spindle forms through the migration of the centrioles.
	8. Chromosomal material replicates.
	9. Chromosomes first appear to be duplex structures.
	10. Chromosomes attach to the spindle fibers.
	11. A cleavage furrow forms during this phase.
	12. The nuclear membrane is absent during the entire phase.
	13. A cell carries out its <i>usual</i> metabolic activities.
Complete the foll	owing statements. Insert your answers in the answer blanks.
	1. Division of the (1) is referred to as mitosis. Cytokinesis is
	the division of the <u>(2)</u> . The major structural difference 2. between chromatin and chromosomes is that the latter are
	3. Chromosomes attach to the spindle fibers by undivided3. structures called4. If a cell undergoes nuclear division bu
	not cytoplasmic division, the product is a <u>(5)</u> . The structure 4. that acts as a scaffolding for chromosomal attachment and
	movement is called the <u>(6)</u> . <u>(7)</u> is the period of cell life 5. when the cell is not involved in division.
	6.

Protein Synthesis

16. Figure 3–8 is a diagram illustrating protein synthesis. Select four different colors, and use them to color the coding circles and the corresponding structures in the diagram. Next, using the letters of the genetic code, label the nitrogen bases on strand 2 of the DNA double helix, on the mRNA strands, and on the tRNA molecules. Then, answer the questions that follow referring to Figure 3–8, inserting your answers in the answer blanks.

Backbones of the DNA double helix tRNA molecules

Backbone of the mRNA strands

Amino acid molecules

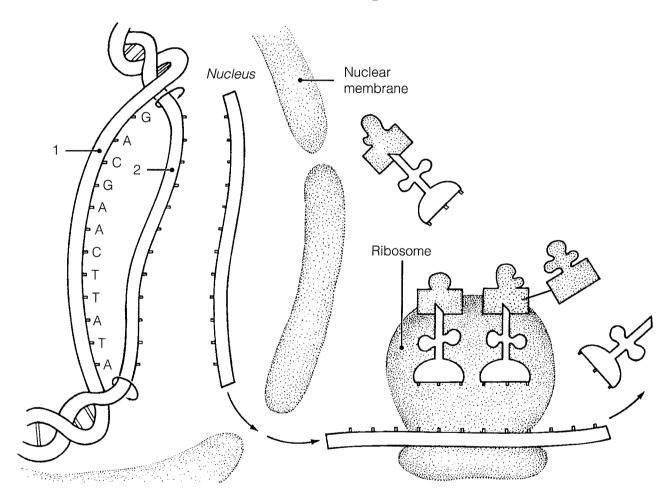

Figure 3-8

- 1. Transfer of the genetic message from DNA to mRNA is called _____
- 2. Assembly of amino acids according to the genetic information carried by mRNA is called
- 3. The set of three nitrogen bases on tRNA that is complementary to an mRNA codon is called

a ______. The complementary three-base sequence on DNA is called a

BODY TISSUES

17.	7. Twelve tissue types are diagrammed in Figure 3–9. Identify each tissue type by inserting the correct name in the blank below it on the diagram. Select different colors for the following structures and use them to color the coding circles and corresponding structures in the diagrams.				
	Epithelial cells	Nerve cells			
	Muscle cells	Matrix (Where found, matrix should be colored differently from the living cells of that tissue type. Be careful; this may not be as easy as it seems!)			
Æ	1		В

21. The three types of muscle tissue exhibit certain similarities and differences. Check (✓) the appropriate spaces in the following table to indicate which muscle types exhibit each characteristic.

	Characteristic	Skeletal	Cardiac	Smooth
1.	Voluntarily controlled			
2.	Involuntarily controlled			
3.	Banded appearance			
4.	Single nucleus in each cell			
5.	Multinucleate			
6.	Found attached to bones			
7.	Allows you to direct your eyeballs			
4	Found in the walls of stomach, uterus, and arteries			
9.	Contains spindle-shaped cells			
	Contains cylindrical cells with branching ends			
	Contains long, nonbranching cylindrical cells			
12.	Displays intercalated discs			
1	Concerned with locomotion of the body as a whole			
1	Changes the internal volume of an organ as it contracts			
15. ′	Tissue of the circulatory pump			

22. Circle the term that does not belong in each of the following groupings.

1. Collagen	Cell	Matrix	Cell product
2. Cilia	Flagellum	Microvilli	Elastic fibers
3. Glands	Bones	Epidermis	Mucosae
4. Adipose	Hyaline	Osseous	Nervous
5. Blood	Smooth	Cardiac	Skeletal

23.	Using the key choices, identify the following connective tissue types. Insert
	the appropriate letter or corresponding term in the answer blanks.

Key Choices

A. Adipose connective tissue	C. Dense fibrous connective tissue	E. Reticular connective tissue			
B. Areolar connective tissue	D. Osseous tissue	F. Hyaline cartilage			
1.	Provides great strength through para fibers; found in tendons	llel bundles of collagenic			
2.	Acts as a storage depot for fat

1.	The nonspecific response of the booregeneration.	ly to injury is called			
2.	Intact capillaries near an injury dilate and <u>antibodies</u> , which cause the blo surface dries to form a scab.				
3.	During the first phase of tissue repaclot, forming a delicate pink tissue of				
4.	When damage is not too severe, the beneath the dry scab and across the tissue. This repair process is called 1	surface of the granulation			

materily & Hystology Co.	oning workbook
	5. If tissue damage is very severe, tissue repair is more likely to occur by <u>fibrosis</u> , or scarring.
	6. During fibrosis, fibroblasts in the granulation tissue lay down keratin fibers, which form a strong, compact, but inflexible mass.
	7. The repair of cardiac muscle and nervous tissue occurs only by <u>fibrosis</u> .
DEVELOPMENTAL A	ASPECTS OF CELLS AND TISSUES
25. Correctly complete each state answer blanks.	itement by inserting your responses in the
	Mitotic cell division is very important for overall body(2) All tissues except(3)_ tissue continue to undergo cell division until the end of adolescence. After this time,(4)_ tissue also becomes amitotic. When amitotic tissues are damaged, they are replaced by(5)_ tissue, which does not function in the same way as the original tissue. This is a serious problem when heart cells are damaged. Aging begins almost as soon as we are born. Three explanations of the aging process have been offered. One states that(6)_ insults, such as the presence of toxic substances in the blood, are important. Another theory states that external(7)_ factors, such as X rays, help to cause aging. A third theory suggests that aging is programmed in our(8) Three examples of aging processes seen in all people are(9)_, (10)_ and (11)
11121314	(13) and (14). The (15) type tends to stay localized and have a capsule. The (16) type is likely to invade other body tissues and spread to other (distant) parts of the body. To correctly diagnose the type of neoplasm, a microscopic examination of the tissue called a (17) is usually done. Whenever possible, (18) is the treatment of choice for neoplasms.
	An overgrowth of tissue that is not considered to be a neoplasm is referred to as <u>(19)</u> . Conversely, a decrease in the size of an organ or tissue, resulting from loss of normal stimulation, is called <u>(20)</u> .
19	

20.

A Visualization Exercise for the Cell

A long, meandering membrane with dark globules clinging to its outer surface now comes into sight.

26. Where necessary, complete state the answer blanks.	ements by inserting the missing words in
1 1 2 3 4.	For your second journey, you will be miniaturized to the size of a small protein molecule and will travel in a microsubmarine, specially designed to enable you to pass easily through living membranes. You are injected into the intercellular space between two epithelial cells, and you are instructed to observe one of these cells firsthand and to identify as many of its structures as possible.
5. 6.	You struggle briefly with the controls and then maneuver your microsub into one of these cells. Once inside the cell, you find yourself in a kind of "sea." This salty fluid that surrounds you is the(1)_ of the cell.
sub for a readout indicating which r	Far below looms a large, dark, oval structure, much larger than anything else you can see. You conclude that it is the(2) As you move downward, you pass a cigar-shaped structure with strange-looking folds on its inner surface. Although you have a pretty good idea that it must be a(3)_, you decide to investigate more thoroughly. After passing through the external membrane of the structure, you are confronted with yet another membrane. Once past this membring structure. You activate the analyzer switch in your micronolecules are in your immediate vicinity. As suspected, there is molecules. Having satisfied your curiosity, you leave this structure.
sight. You maneuver closer and sit be together, and a long, threadlike protes membrane, therefore, is the(6) tentatively identified earlier. On appropenings in its outer wall; these openings, you discover that from the insit twined masses of(8)_, which you cules. Making your way through this appear to be full of the same type of	dark globules clinging to its outer surface now comes into each to watch the activity. As you watch, amino acids are joined ein molecule is built. The globules must be(5)_, and the Once again, you head toward the large dark structure seen and roach, you observe that this huge structure has very large enings must be the(7) Passing through one of these opende, the color of this structure is a result of dark, coiled, interranalyzer confirms contain genetic material, or(9)_ molestangled mass, you pass two round, dense structures that if globules you saw outside. These two round structures are a your earlier identification of this cellular structure, so now you ervations.

11	That about any milest appear to be a second in a Color
11.	Just ahead, you see what appears to be a mountain of flat-
	tened sacs with hundreds of small saclike vesicles at its
12.	edges. The vesicles seem to be migrating away from this area
	and heading toward the outer edges of the cell. The mountain
	of sacs must be the (11). Eventually you come upon a

rather simple-looking membrane-bound sac. Although it doesn't look too exciting and has few distinguishing marks, it does not resemble anything else you have seen so far. Deciding to obtain a chemical analysis before entering this sac, you activate the analyzer and on the screen you see "Enzymes — Enzymes — Hydrolases — Hydrolases — Danger — Danger." There is little doubt that this innocent-appearing structure is actually a __(12)_.

Completing your journey, you count the number of organelles identified so far. Satisfied that you have observed most of them, you request retrieval from the intercellular space.

27. Johnny lacerated his arm and rushed home to Mom so she could "fix it." His mother poured hydrogen peroxide over the area, and it bubbled vigorously where it came in contact with the wound. Because you can expect that cells were ruptured in the injured area, what do you *think* was happening here?

28. The epidermis (epithelium of the cutaneous membrane or skin) is a keratinized stratified squamous epithelium. Explain why that epithelium is much better suited for protecting the body's external surface than a mucosa consisting of a simple columnar epithelium would be.

29. Streptomycin (an antibiotic) binds to the small ribosomal subunit of bacteria (but not to the ribosomes of the host cells infected by bacteria). The result is the misreading of bacteria mRNA and the breakup of polysomes. What process is being affected, and how does this kill the bacterial cells?

30. Systemic lupus erythematosus (often simply called lupus) is a condition that sometimes affects young women. It is a chronic (persistent) inflammation that affects all or most of the connective tissue proper in the body. Suzy is told by her doctor that she has lupus, and she asks if it will have widespread or merely localized effects within the body. What would the physician answer?

31. Mrs. Linsey sees her gynecologist because she is unable to become pregnant. The doctor discovers granulation tissue in her vaginal canal and explains that sperm are susceptible to some of the same chemicals as bacteria. What is inhibiting the sperm?

32. Sarah, a trainee of the electron microscopist at the local hospital, is reviewing some micrographs of muscle cells and macrophages (phagocytic cells). She notices that the muscle cells are loaded with mitochondria while the macrophages have abundant lysosomes. Why is this so?

33. Bradley tripped and tore one of the tendons surrounding his ankle. In anguish with pain, he asked his doctor how quickly he could expect it to heal. What do you think the doctor's response was and why?

34. In normally circulating blood, the plasma proteins cannot leave the bloodstream easily and, thus, tend to remain in the blood. But if stasis (blood flow stoppage) occurs, the proteins will begin to leak out into the interstitial fluid. Explain why this leads to edema (water buildup in the tissues).

THE FINALE: MULTIPLE CHOICE

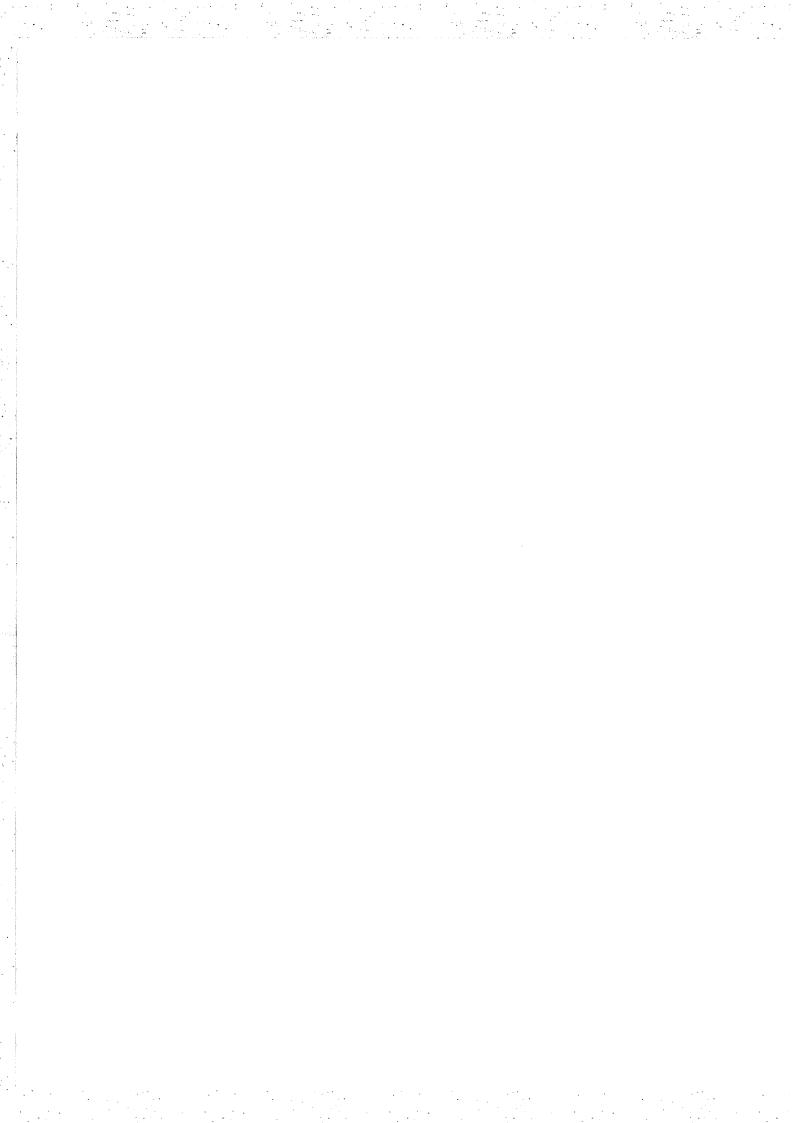

- 35. Select the best answer or answers from the choices given.
- 1. A cell's plasma membrane would not contain:
 - A. phospholipid
- D. cholesterol
- B. nucleic acid
- E. glycolipid
- C. protein
- 2. Which of the following would you expect to find in or on cells whose main function is absorption?
 - A. Microvilli
- D. Gap junctions
- B. Cilia
- E. Secretory vesicles
- C. Desmosomes
- 3. Which cytoskeletal element interacts with myosin to produce contractile force in muscle cells?
 - A. Microtubules
 - B. Microfilaments
 - C. Intermediate filaments
 - D. None of the above
- 4. If a 10% sucrose solution within a semipermeable sac causes the fluid volume in the sac to increase a given amount when the sac is immersed in water, what would be the effect of replacing the sac solution with a 20% sucrose solution?
 - A. The sac would lose fluid.
 - B. The sac would gain the same amount of fluid.
 - C. The sac would gain more fluid.
 - D. There would be no effect.
- 5. Which of the following are possible functions of the glycocalyx?
 - A. Determination of blood groups
 - B. Binding sites for toxins
 - C. Aiding the binding of sperm to egg
 - D. Guiding embryonic development
 - E. Increasing the efficiency of absorption

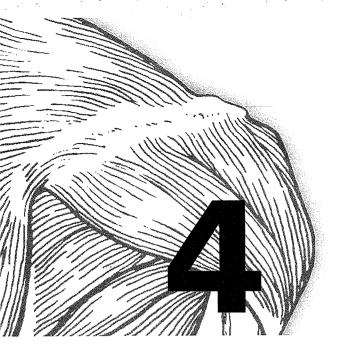

- 6. A cell stimulated to increase steroid production will have:
 - A. abundant ribosomes
 - B. a rough ER
 - C. a smooth ER
 - D. a Golgi apparatus
 - E. abundant secretory vesicles
- 7. A cell's ability to replenish its ATP stores has been diminished by a metabolic poison. What organelle is most likely to be affected?
 - A. Nucleus
 - B. Plasma membrane
 - C. Centriole
 - D. Microtubule
 - E. Mitochondrion
- 8. The fundamental structure of the plasma membrane is determined almost exclusively
 - A. phospholipid molecules
 - B. peripheral proteins
 - C. cholesterol molecules
 - D. integral proteins
- 9.–11. Consider the following information for Questions 9–11:
 - A DNA segment has this nucleotide sequence:
 - AAGCTCTTACGAATATTC
- 9. Which mRNA is complementary?
 - A. AAGCTCTTACGAATATTC
 - B. TTCGAGAATGCTTATAAG
 - C. AAGCUCUUACGAAUAUUC
 - D. UUCGAGAAUGCUUAUAAG

10.	How	many	amino	acids	are	coded	in	this
	segm	ent?						

- A. 18
- C. 6
- B. 9
- D. 3
- 11. What is the tRNA anticodon sequence for the fourth codon from the left?
 - A. G
- C. GCU
- B. GC
- D. CGA
- 12. The organelle that consists of a stack of 3–10 membranous discs associated with vesicles is:
 - A. mitochondrion
 - B. smooth ER
 - C. Golgi apparatus
 - D. lysosome
- 13. An epithelium "built" to stretch is:
 - A. simple squamous
 - B. stratified squamous
 - C. simple cuboidal
 - D. pseudostratified
 - E. transitional
- 14. Which of the following fibrous elements give a connective tissue high tensile strength?
 - A. Reticular fibers
 - B. Elastic fibers
 - C. Collagen fibers
 - D. Myofilaments

- 15. Viewed through the microscope, most cells in this type of tissue have only a rim of cytoplasm.
 - A. Reticular connective
 - B. Adipose connective
 - C. Areolar connective
 - D. Osseous tissue
 - E. Hyaline cartilage
- 16. Which type of cartilage is most abundant throughout life?
 - A. Elastic cartilage
 - B. Fibrocartilage
 - C. Hyaline cartilage
- 17. Which of the following terms describe skeletal muscle?
 - A. Striated
 - B. Intercalated discs
 - C. Multinucleated
 - D. Voluntary
 - E. Branching
- 18. Events of tissue repair include:
 - A. regeneration
 - B. organization
 - C. granulation
 - D. fibrosis
 - E. inflammation

SKIN AND BODY MEMBRANES

Body membranes, which cover body surfaces, line its cavities, and form protective sheets around organs, fall into two major categories. These are epithelial membranes (skin epidermis, mucosae, and serosae) and the connective tissue synovial membranes.

Topics for review in this chapter include a comparison of structure and function of various membranes, anatomical characteristics of the skin (composed of the connective tissue dermis and the epidermis) and its derivatives, and the manner in which the skin responds to both internal and external stimuli to protect the body.

CLASSIFICATION OF BODY MEMBRANES

1. Complete the following table relating to body membranes. Enter your responses in the areas left blank.

Membrane	Tissue type (epithelial/connective)	Common locations	Functions
Mucous			
Serous			
Cutaneous			
Synovial			

2. Four simplified diagrams are shown in Figure 4-1. Select different colors for the membranes listed below, and use them to color the coding circles and the corresponding structures. Cutaneous membrane Parietal pleura (serosa) Synovial membrane Mucosae Visceral pericardium (serosa) Visceral pleura (serosa) Parietal pericardium (serosa)

Figure 4-1

INTEGUMENTARY SYSTEM (SKIN)

Basic Functions of the Skin

3.	The skin protects the body by providing three types of barriers. Classify each of the protective factors listed below as an example of a chemical barrier (C), a biological barrier (B), or a mechanical (physical) barrier (M).
	1. Langerhans' cells and macrophages
	2. Intact epidermis
	3. Bactericidal secretions
	4. Keratin
	5. Melanin
	6. Acid mantle
4.	In what way does a sunburn impair the body's ability to defend itself?
	(Assume the sunburn is mild.)
	Explain the role of sweat glands in maintaining body temperature homeostasis. In your explanation, indicate how their activity is regulated.
6.	Complete the following statements. Insert your responses in the answer blanks.
	1. The cutaneous sensory receptors that reside in the skin are actually part of the(1)_ system. Four types of stimuli that 2. can be detected by certain of the cutaneous receptors are(2)_,(3)_,(4)_, and(5) 3. Vitamin D is synthesized when modified(6) molecules in the skin are irradiated by(7)_ light. Vitamin D is important in the absorption and metabolism of(8) ions. 5
	8.

Basic Structure of the Skin

7. Figure 4–2 depicts a longi of the skin. Label the skin areas indicated by leader li on the figure. Select different structures below and color	structures and ines and brackets ent colors for the the coding cir-
cles and the corresponding the figure.	g structures on
Arrector pili muscle	AL-AL-AL-AL-AL-AL-AL-AL-AL-AL-AL-AL-AL-A
Adipose tissue	
Hair follicle	
Nerve fibers	
Sweat (sudoriferous) gland	
Sebaceous gland	
	/ Figure 4–2

8. The more superficial cells of the epidermis become less viable and ultimately die. What two factors account for this natural demise of the epidermal cells?

1.	
2.	

9. Using the key choices, choose all responses that apply to the following descriptions. Enter the appropriate letter(s) or term(s) in the answer blanks.

	Key Choices							
	A. Stratum basal	e	D. Stratum	lucidum	G. Retio	cular layer		
	B. Stratum corne	eum	E. Stratum	spinosum	H. Epid	ermis as a	whole	
	C. Stratum granu	ılosum	F. Papillar	y layer	I. Derr	nis as a wł	nole	
		1.	Translucent	cells, containir	ng keratin			
		2.	Strata contai	ining all or mo	stly dead c	ells		
		3.	Dermis laye	r responsible f	or fingerpri	nts		
		4.	Vascular reg	ion				
		5.	Epidermal r epidermal la	egion involved ayer	l in rapid ce	ell division	; most inferior	
		6.	Scalelike ce	lls full of kerat	in that cons	stantly flak	e off	
		7.	Site of elast	ic and collager	n fibers			
		8.	Site of mela	nin formation				
		9.	Major skin a	area from whic	th the deriv	atives (hai	r, nails) arise	
		10.	Epidermal l	ayer containing	g the oldest	cells		
		11.	When tanne	ed becomes lea	ather			
10.	Circle the term t	hat does not	belong in e	ach of the follo	owing grou	pings.		
	1. Reticular laye	r Ker	atin I	Dermal papillae	e Me	eissner's co	orpuscles	
	2. Melanin	Freckle	Wart	Malignan	t melanoma	a		
	3. Prickle cells	Stratu	m basale	Stratum sp	oinosum	Cell sl	hrinkage

Keratin fibrils

7. Intermediate filaments

Keratohyaline

Lamellated granules

11. This exercise examines the relative importance of three pigments in determining skin color. Indicate which pigment is identified by the following descriptions by inserting the appropriate answer from the key choices in the answer blanks.

	Key Choices			
	A. Carotene	В	. Hemoglobin	C. Melanin
		_ 1	. Most responsible for the sl	kin color of dark-skinned people
		_ 2	. Provides an orange cast to	the skin
		_ 3	Provides a natural sunscre	en
		_ 4	Most responsible for the sl	kin color of Caucasians
		_ 5	Phagocytized by keratinoc	ytes
		_ 6.	Found predominantly in the	ne stratum corneum
		_ 7.	Found within red blood ce	ells in the blood vessels
12.	Complete the following st	state	ements in the blanks provide	ed.
		_ 1.		rface and evaporation of sweat are n helps to get rid of body(1)
		_ 2.	Fat in the(2)_ tissue lay the body.	er beneath the dermis helps to insulate
		_ 3.	A vitamin that is manufactu	ared in the skin is (3) .
		4.	Wrinkling of the skin is cau	used by loss of the <u>(4)</u> of the skin.
		_ 5.	A decubitus ulcer results w	then skin cells are deprived of <u>(5)</u> .
		₋ 6.	(6) is a bluish cast of the oxygenation of the blood.	ne skin resulting from inadequate
٩p	pendages of the	e S	kin	
13.	For each true statement, wunderlined word(s) and in	writ nse:	e T. For each false statement your correction in the ans	nt, correct the wer blank.
		1.	A saltwater solution is secre	eted by <u>sebaceous</u> glands.
		2.	The most abundant protein as hair and nails is melanin	in dead epidermal structures such
		3.	Sebum is an oily mixture o	f lipids, cholesterol, and cell fragments.
		4.	The externally observable p	part of a hair is called the <u>root</u> .
		5.	The epidermis provides me	echanical strength to the skin.

- **14.** Figure 4–3 is a diagram of a cross-sectional view of a hair in its follicle. Complete this figure by following the directions in steps 1–3.
 - 1. Identify the two portions of the follicle wall by placing the correct name of the sheath at the end of the appropriate leader line.
 - 2. Use different colors to color these regions.
 - 3. Label, color-code, and color the three following regions of the hair.
 - () Cortex
- () Cuticle
- Medulla

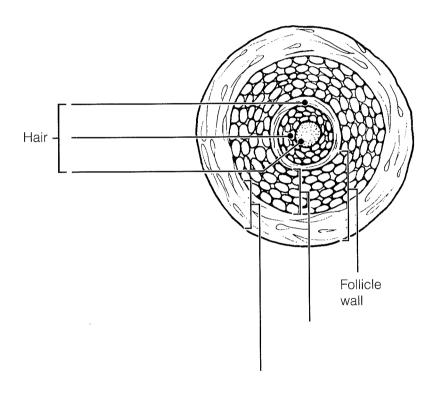

Figure 4-3

15. Circle the term that does not belong in each of the following groupings.

Good blood supply Poor nutrition Testosterone 1. Luxuriant hair growth Cholesterol UV radiation Keratin 2. Vitamin D Stratum basale Hair bulb Nail matrix 3. Stratum corneum Axilla Eccrine glands Apocrine glands 4. Scent glands Eyebrow hair Vellus hair Dark, coarse hair 5. Terminal hair **16.** What is the scientific term for baldness? _

18.

17. Using the key choices, complete the following statements. Insert the appropriate letter(s) or term(s) in the answer blanks.

Key Choices						
A. Arrector pili	C. Hair	E. Seba	ceous glands	G. Sweat gland (eccrine)		
B. Cutaneous recep	otors D. Hair fo	ollicle(s) F. Swea	t gland (apocri	ne)		
	1. A blac		nulation of oily	material produced by		
		nuscles attached to fright or cold are		hat pull the hair upright		
-	3. The m	ost numerous vari	ety of perspirat	ion gland is the <u>(3)</u> .		
	4. A shea the(epithelial and	connective tissues is		
	secretion		appearance) c	gland is the <u>(5)</u> . Its ontains proteins and owth.		
	hands,	(6) is found everywhere on the body except the palms of the hands, soles of the feet, and lips, and it primarily consists of dead keratinized cells.				
7. (7) are specialized nerve endings that respond to temper and touch, for example.						
	8. (8)	become more act	ive at puberty.			
	9. Part of	the heat-liberating	g apparatus of t	the body is the <u>(9)</u> .		
	10. Secreting	n contains bacteria	ı–killing substa	nces.		
Circle the term that	does not belong	in each of the fol	lowing groupir	ıgs.		
1. Sebaceous gland	Hair	Arrector pi	li Epid	ermis		
2. Radiation	Absorption	Conduct	ion I	Evaporation		
3. Stratum corneum	Nails	Hair	Stratum bas	cale		
4. Scent glands	Eccrine glar	nds Apoc	rine glands	Axilla		
5. Cyanosis	Erythema	Wrinkles	Pallor			

Homeostatic Imbalances of the Skin

19. Overwhelming infection is one of the most important causes of death in burn patients. What is the other major problem they face, and what are its possible consequences?						
correct burn type for ea	This section reviews the severity of burns. Using the key choices, select the correct burn type for each of the following descriptions. Enter the correct answers in the answer blanks.					
Key Choices						
A. First-degree burn	B. Second-degree burn C. Third-degree burn					
	1. Full-thickness burn; epidermal and dermal layers destroyed; skin is blanched					
	2. Blisters form					
	3. Epidermal damage, redness, and some pain (usually brief)					
	4. Epidermal and some dermal damage; pain; regeneration is possible					
	5. Regeneration impossible; requires grafting					
	6. Pain is absent because nerve endings in the area are destroyed					
21. What is the importance	e of the "rule of nines" in treatment of burn patients?					
22. Fill in the type of skin descriptions:	cancer that matches each of the following					
	 Epithelial cells, not in contact with the basement membrane, develop lesions; metastasize 					
	2. Cells of the lowest level of the epidermis invade the dermis and hypodermis; exposed areas develop ulcer; slow to metastasize					
	3. Rare but often deadly cancer of pigment-producing cells					
23. What does ABCD mean	n in reference to examination of pigmented areas?					

DEVELOPMENTAL ASPECTS OF THE SKIN AND BODY MEMBRANES

24. Match the choices (letters or terms) in Column B with the appropriate descriptions in Column A.

Column A	Column B
 1. Skin inflammations that increase in frequency with age	A. Acne
2. Cause of graying hair	B. Cold intolerance
2. Cause of graying fram	C. Dermatitis
3. Small white bumps on the skin of newborn babies, resulting from accumulations of sebaceous gland	D. Delayed-action gene
material	E. Lanugo
4. Reflects the loss of insulating subcutaneous tissue with age	F. Milia
5. A common consequence of accelerated sebaceous gland activity during adolescence	G. Vernix caseosa
6. Oily substance produced by the fetus's sebaceous glands	
7. The hairy "cloak" of the fetus	

INCREDIBLE JOURNEY

A Visualization Exercise for the Skin

Your immediate surroundings resemble huge grotesquely twisted vines . . . you begin to climb upward.

25. Where necessary, complete statements by inserting the missing words in the answer blanks.					
	 2. 	For this trip, you are miniaturized for injection into your host's skin. Your journey begins when you are deposited in a soft gel-like substance. Your immediate surroundings resemble huge grotesquely twisted vines. But when you peer carefully at the closest "vine," you realize you are actually seeing con-			
strong cables. You identify the	se as t	d together, most of the fibers are fairly straight and look like he(1)_ fibers. Here and there are fibers that resemble(2)_ fibers that help give skin its springiness. At this point,			

5.
 4.
 5.
 6.
7.
8.
9.
10.

there is little question that you are in the <u>(3)</u> region of the skin, particularly considering that you can also see blood vessels and nerve fibers around you.

Carefully, using the fibers as steps, you begin to climb upward. After climbing for some time and finding that you still haven't reached the upper regions of the skin, you stop for a rest. As you sit, a strange-looking cell approaches, moving slowly with parts alternately flowing forward and then receding. Suddenly you realize that this must be a ___(4)__ that is about to dispose of an intruder (you) unless you move in a hurry! You scramble to your feet and resume your upward climb. On your right is a large fibrous structure that looks like a tree trunk anchored in place by muscle fibers. By scurrying up this ___(5)__ sheath, you are able to escape from the cell. Once safely out of harm's way, you again scan your surroundings. Directly overhead are tall cubelike cells, forming a continuous

sheet. In your rush to escape you have reached the <u>(6)</u> layer of the skin. As you watch the activity of the cells in this layer, you notice that many of the cells are pinching in two, and the daughter cells are being forced upward. Obviously, this is the layer that continually replaces cells that rub off the skin surface, and these cells are the <u>(7)</u> cells.

Looking through the transparent cell membrane of one of the basal cells, you see a dark mass hanging over its nucleus. You wonder if this cell could have a tumor; but then, looking through the membranes of the neighboring cells, you find that they also have dark umbrella-like masses hanging over their nuclei. As you consider this matter, a black cell with long tentacles begins to pick its way carefully between the other cells. As you watch with interest, one of the transparent cells engulfs the tip of one of the black cell's tentacles. Within seconds a black substance appears above the transparent cell's nucleus. Suddenly, you remember that one of the skin's functions is to protect the deeper layers from sun damage; the black substance must be the protective pigment, (8).

Once again you begin your upward climb and notice that the cells are becoming shorter and harder and are full of a waxy-looking substance. This substance has to be __(9)_, which would account for the increasing hardness of the cells. Climbing still higher, the cells become flattened like huge shingles. The only material apparent in the cells is the waxy substance—there is no nucleus, and there appears to be no activity in these cells. Considering the clues—shingle-like cells, no nuclei, full of the waxy substance, no activity—these cells are obviously _(10)_ and therefore very close to the skin surface.

Suddenly, you feel a strong agitation in your immediate area. The pressure is tremendous. Looking upward through the transparent cell layers, you see your host's fingertips vigorously scratching the area directly overhead. You wonder if you are causing his skin to sting or tickle. Then, within seconds, the cells around you begin to separate and fall apart, and you are catapulted out into the sunlight. Since the scratching fingers might descend once again, you quickly advise your host of your whereabouts.

- **26.** Mrs. Ibañez volunteered to help at a hospital for children with cancer. When she first entered the cancer ward, she was upset by the fact that most of the children had no hair. What is the explanation for their baldness?
- **27.** A new mother brings her infant to the clinic, worried about a yellowish, scummy deposit that has built up on the baby's scalp. What is this condition called, and is it serious?
- **28.** Patients in hospital beds are rotated every 2 hours to prevent bedsores. Exactly why is this effective?
- **29.** Eric and his wife are of northern European descent. Eric is a proud new father who was in the delivery room during his daughter's birth. He tells you that when she was born, her skin was purple and covered with a cream—cheese-like substance. Shortly after birth, her skin turned pink. Can you explain his observations?
- **30.** Would you expect to find the highest rate of skin cancer among the Blacks of tropical Africa, research scientists in the Arctic, Norwegians in the Southern United States, or Blacks in the United States? Explain your choice.

31.	After studying the skin in anatomy class, Toby grabbed the large "love
	handles" at his waist and said, "I have too thick a hypodermis, but that's okay
	because this layer performs some valuable functions!" What are the functions
	of the hypodermis?

32. A man got his finger caught in a machine at the factory. The damage was less serious than expected, but nonetheless, the entire nail was torn from his right index finger. The parts lost were the body, root, bed, matrix, and cuticle of the nail. First, define each of these parts. Then, tell if this nail is likely to grow back.

33. In cases of a ruptured appendix, what serous membrane is likely to become infected? Why can this be life threatening?

34. Mrs. Gaucher received second-degree burns on her abdomen when she dropped a kettle of boiling water. She asked the clinic physician (worriedly) if she would have to have a skin graft. What do you think he told her?

35. What two factors in the treatment of critical third-degree burn patients are absolutely essential?

THE FINALE: MULTIPLE CHOICE

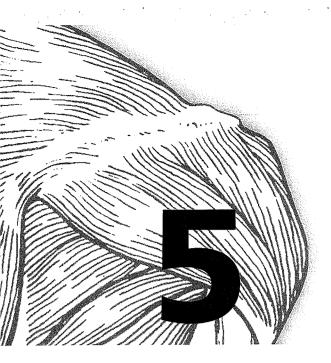

- **36.** Select the best answer or answers from the choices given.
 - 1. Which is not part of the skin?
 - A. Epidermis
- C. Dermis
- B. Hypodermis
- D. Superficial fascia
- 2. Which of the following is *not* a tissue type found in the skin?
 - A. Stratified squamous epithelium
 - B. Loose connective tissue
 - C. Dense irregular connective tissue
 - D. Ciliated columnar epithelium
 - E. Vascular tissue
- 3. Epidermal cells that aid in the immune response include:
 - A. Merkel cells
- C. melanocytes
- B. Langerhans' cells
- D. spinosum cells
- 4. Which epidermal layer has the highest concentration of Langerhans' cells and has numerous desmosomes and thick bundles of keratin filaments?
 - A. Stratum corneum
 - B. Stratum lucidum
 - C. Stratum granulosum
 - D. Stratum spinosum
- 5. Fingerprints are caused by:
 - A. the genetically determined arrangement of dermal papillae
 - B. the conspicuous epidermal ridges
 - C. the sweat pores
 - D. all of these
- 6. Some infants are born with a fuzzy skin; this is due to:
 - A. vellus hairs
- C. lanugo
- B. terminal hairs
- D. hirsutism

- 7. What is the major factor accounting for the waterproof nature of the skin?
 - A. Desmosomes in stratum corneum
 - B. Glycolipid between stratum corneum cells
 - C. The thick insulating fat of the hypodermis
 - D. The leathery nature of the dermis
- 8. Which of the following is *true* concerning oil production in the skin?
 - A. Oil is produced by sudoriferous glands.
 - B. Secretion of oil is the job of the apocrine glands.
 - C. The secretion is called sebum.
 - D. Oil is usually secreted into hair follicles.
- 9. Contraction of the arrector pili would be "sensed" by:
 - A. Merkel discs
 - B. Meissner's corpuscles
 - C. hair follicle receptors
 - D. Pacinian corpuscles
- 10. A dermatologist examines a patient with lesions on the face. Some of the lesions appear as shiny, raised spots; others are ulcerated with beaded edges. What is the diagnosis?
 - A. Melanoma
 - B. Squamous cell carcinoma
 - C. Basal cell carcinoma
 - D. Either squamous or basal cell carcinoma

- 11. A burn patient reports that the burns on her hands and face are not painful, but she has blisters on her neck and forearms and the skin on her arms is very red. This burn would be classified as:
 - A. first-degree only
 - B. second-degree only
 - C. third-degree only
 - D. critical

- 12. The reticular layer of the dermis is most important in providing:
 - A. strength and elasticity to the skin
 - B. toughness to the skin
 - C. insulation to prevent heat loss
 - D. the dermal papilla, which produce fingerprints

THE SKELETAL SYSTEM

The skeleton is constructed of two of the most supportive tissues found in the human body—cartilage and bone. Besides supporting and protecting the body as an internal framework, the skeleton provides a system of levers that the skeletal muscles use to move the body. In addition, the bones provide a storage depot for substances such as lipids and calcium, and blood cell formation goes on within their red marrow cavities.

The skeleton consists of bones connected at joints, or articulations, and is subdivided into two divisions. The axial skeleton includes those bones that lie around the body's center of gravity. The appendicular skeleton includes the bones of the limbs.

Topics for student review include structure and function of long bones, location and naming of specific bones in the skeleton, fracture types, and a classification of joint types in the body.

BONES—AN OVERVIEW

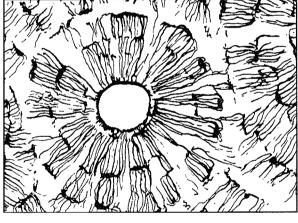

1.	1. Classify each of the following terms as a projection (P) or a depression or opening (D) . Enter the appropriate letter in the answer blanks.				
	1. Condyle	4. Foramen	7. Ramus		
	2. Crest	5. Head	8. Spine		
	3. Fissure	6. Meatus	9. Tuberosity		
2.		one, S for short bone,	If the four major bone cate- F for flat bone, and I for irreguace provided.		
	1. Calcaneus	4. Humerus	7. Radius		
	2. Frontal	5. Mandible	8. Sternum		
	3. Femur	6. Metacarpal	9. Vertebra		

 Using the key choices, characterize the following statements relating to long bones. Enter the appropriate term(s) or letter(s) in the answer blanks. 			
Key Choices			
A. Diaphysis	C. Epiphysis E. Yellow marrow cavity		
B. Epiphyseal pla	e D. Red marrow		
	1. Site of spongy bone in the adult		
	2. Site of compact bone in the adult		
	3. Site of hematopoiesis in the adult		
	4. Scientific name for bone shaft		
	5. Site of fat storage in the adult		
	6. Site of longitudinal growth in a child		
Key Choices A. Atrophy	C. Gravity E. Osteoclasts G. Parathyroid hormone		
B. Calcitonin	D. Osteoblasts F. Osteocytes H. Stress and/or tension		
	1. When blood calcium levels begin to drop below homeostatic levels, (1) is released, causing calcium to be released from bones.		
	2. Mature bone cells, called (2), maintain bone in a viable state.		
	3. Disuse such as that caused by paralysis or severe lack of exercise results in muscle and bone(3)		
	4. Large tubercles and/or increased deposit of bony matrix occur at sites of <u>(4)</u> .		
5. Immature, or matrix-depositing, bone cells are referred to			
	6. (6) causes blood calcium to be deposited in bones as calcium salts.		
	7. Bone cells that liquefy bone matrix and release calcium to the blood are called <u>(7)</u> .		
	8. Our astronauts must do isometric exercises when in space because		

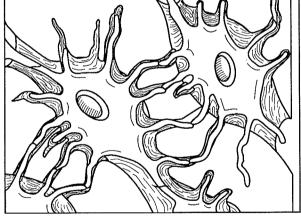

bones atrophy under conditions of weightlessness or lack of (8).

5. Five descriptions of bone structure are provided in Column A. First identify the structure by choosing the appropriate term from Column B and placing the corresponding answer in the answer blank. Then consider Figure 5–1A, a diagrammatic view of a cross section of bone, and Figure 5–1B, a higher magnificated view of compact bone tissue. Select different colors for the structures and bone areas in Column B, and use them to color the coding circles and corresponding structures on the figure diagrams. Because the concentric lamellae would be difficult to color without confusing other elements, identify one lamella by using a bracket and label.

Column A	Column B
1. Layers of calcified matrix	A. Central (Haversian) canal
2. "Residences" of osteocyte	es B. Concentric lamellae
3. Longitudinal canal, carryi	\circ
blood vessels and nerves	D. Canaliculi
4. Nonliving, structural part of bone	E. Bone matrix (
5. Tiny canals, connecting lacunae	F. Osteocyte

3.	Osteon	Marrow cavity	Central cana	al Canalic	uli
4.	Epiphysis surfac	ce Articular ca	rtilage	Periosteum	Hyaline cartilage

7. Figure 5–2A is a midlevel, cross-sectional view of the diaphysis of the femur. Label the membrane that lines the cavity and the membrane that covers the outside surface.

Figure 5–2B is a drawing of a longitudinal section of the femur. Color the bone tissue gold. Do *not* color the articular cartilage; leave it white. Select different colors for the bone regions listed at the coding circles below. Color the coding circles and the corresponding regions on the drawing. Complete Figure 5–2B by labeling compact bone and spongy bone.

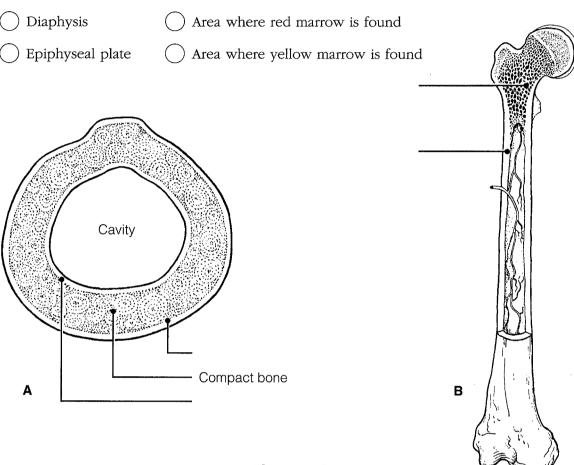

Figure 5-2

- **8.** The following events apply to the endochondral ossification process as it occurs in the primary ossification center. Put these events in their proper order by assigning each a number (1–6).
 - _____ 1. Cavity formation occurs within the hyaline cartilage.
 - 2. Collar of bone is laid down around the hyaline cartilage model just beneath the periosteum.
 - _____ 3. Periosteal bud invades the marrow cavity.
 - 4. Perichondrium becomes vascularized to a greater degree and becomes a periosteum.
 - 5. Osteoblasts lay down bone around the cartilage spicules in the bone's interior.
 - _____ 6. Osteoclasts remove the cancellous bone from the shaft interior, leaving a marrow cavity that then houses fat.

12. An anterior view of the skull, showing the positions of the sinuses, is provided in Figure 5–4. First select different colors for each of the sinuses and use them to color the coding circles and the corresponding structures on the figure. Then briefly answer the following questions concerning the sinuses.

Sphenoid sinus

Ethmoid sinuses

Frontal sinus

Maxillary sinus

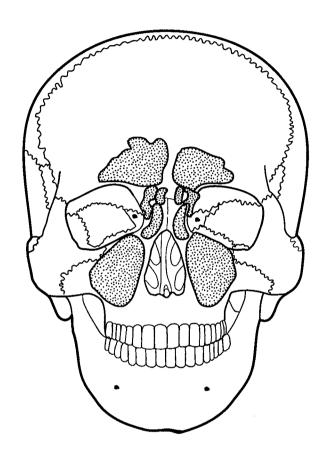

Figure 5-4

1. What are sinuses? _____

2. What purpose do they serve in the skull?

3. Why are they so susceptible to infection?

Vertebral Column

13. Using the key choices, correctly identify the vertebral parts/areas described as follows. Enter the appropriate term(s) or letter(s) in the spaces provided. Key Choices A. Body C. Spinous process E. Transverse process B. Intervertebral foramina D. Superior articular process F. Vertebral arch 1. Structure that encloses the nerve cord 2. Weight-bearing part of the vertebra 3. Provide(s) levers for the muscles to pull against 4. Provide(s) an articulation point for the ribs 5. Openings allowing spinal nerves to pass 14. The following statements provide distinguishing characteristics of the vertebrae composing the vertebral column. Using the key choices, identify each described structure or region by inserting the appropriate term(s) or letter(s) in the spaces provided. Key Choices A. Atlas F. Sacrum D. Coccyx B. Axis G. Thoracic vertebra E. Lumbar vertebra C. Cervical vertebra—typical ___ 1. Type of vertebra(e) containing foramina in the transverse processes, through which the vertebral arteries ascend to reach the brain ______ 2. Its dens provides a pivot for rotation of the first cervical vertebra 3. Transverse processes have facets for articulation with ribs; spinous process points sharply downward 4. Composite bone; articulates with the hip bone laterally 5. Massive vertebrae; weight-sustaining 6. Tailbone; vestigal fused vertebrae __ 7. Supports the head; allows the rocking motion of the occipital condyles 8. Seven components; unfused

______ 9. Twelve components; unfused

15.	Complete the following statements by inserting your answers in the answer blanks.
	1. In describing abnormal curvatures, it could be said that(1) is an exaggerated thoracic curvature, and in(2) the verte
	3. Invertebral discs are made of (3) tissue. The discs provide (4) to the spinal column.
16.	Figure 5–5, A–D shows superior views of four types of vertebrae. In the spaces provided below each vertebra, indicate in which region of the spinal column it would be found. In addition, specifically identify Figure 5–5A. Where indicated by leader lines, identify the vertebral body, spinous and transverse processes, superior articular processes, and vertebral foramen.
	AB

Figure 5-5

17. Figure 5–6 is a lateral view of the vertebral column. Identify each numbered region of the column by listing in the numbered answer blanks the region name first and then the specific vertebrae involved (for example, sacral region, S# to S#). Also identify the modified vertebrae indicated by numbers 6 and 7 in Figure 5–6. Select different colors for each vertebral region and use them to color the coding circles and the corresponding regions.

Thoracic Cage

18 .	Complete the following statements referring to the thoracic cage by inserting	g
	your responses in the answer blanks.	

The organs protected by the thoracic cage include the __(1) and the __(2) _. Ribs 1 through 7 are called __(3) _ ribs, whereas ribs 8 through 12 are called __(4) _ ribs. Ribs 11 and 12 are also called __(5) _ ribs. All ribs articulate posteriorly with the __(6) _, and most connect anteriorly to the __(7) _, either directly or indirectly.

The general shape of the thoracic cage is <u>(8)</u>.

- 7.
- **19.** Figure 5–7 is an anterior view of the thoracic cage. Select different colors to identify the structures below and color the coding circles and corresponding structures. Then label the subdivisions of the sternum indicated by leader lines.

All true ribs

All false ribs

Oostal cartilages

() Sternum

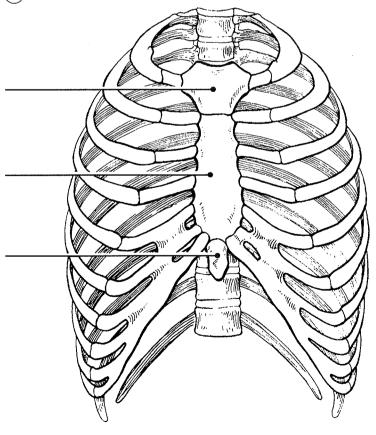

Figure 5-7

APPENDICULAR SKELETON

Several bones forming part of the upper limb and/or shoulder girdle are shown in Figures 5–8 to 5–11. Follow the specific directions for each figure.

- **20.** Identify the bone in Figure 5–8. Insert your answer in the blank below the illustration. Select different colors for each structure listed below and use them to color the coding circles and the corresponding structures in the diagram. Then, label the angles indicated by leader lines.
 - Spine Glenoid cavity Coracoid process Acromion

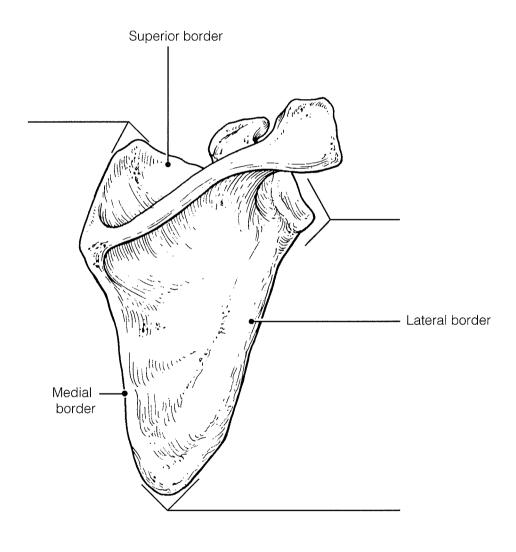

Figure 5-8

21. Identify the bones in Figure 5–9 by labeling the leader lines identified as A, B, and C. Color the bones different colors. Using the following terms, complete the illustration by labeling all bone markings provided with leader lines.

Trochlear notch

Capitulum

Coronoid process

Trochlea

Deltoid tuberosity

Olecranon process

Radial tuberosity

Head (three)

Styloid process

Lesser tubercle

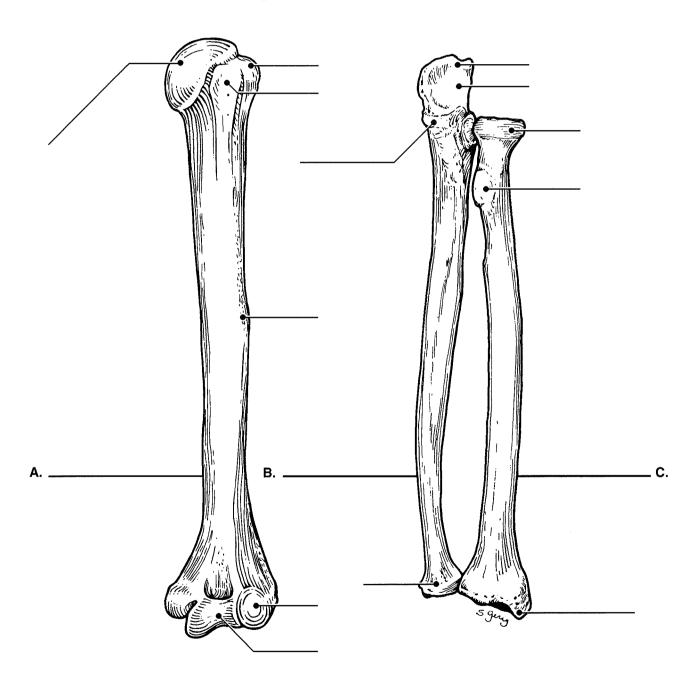

Figure 5-9

22. Figure 5–10 is a diagram of the hand. Select different colors for the following structures, and use them to color the coding circles and the corresponding structures in the diagram.

() Metacarpals

Phalanges

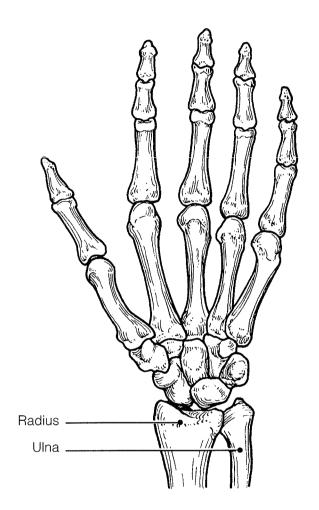

Figure 5-10

23. Compare the pectoral and pelvic girdles by choosing descriptive terms from the key choices. Insert the appropriate key letters in the answer blanks.

Key Choices

A. Flexibility

D. Shallow socket for limb attachment

B. Massive

E. Deep, secure socket for limb attachment

C. Lightweight

F. Weight-bearing

Pectoral: , ,

Pelvic: _____, _____, _____

24. Using the key choices, identify the bone names or markings according to the descriptions that follow. Insert the appropriate term or letter in the answer blanks.

A. Acromion	F. Coronoid fossa	K. Olecranon fossa	P. Scapula
B. Capitulum	G. Deltoid tuberosity	L. Olecranon process	Q. Sternum
C. Carpals	H. Glenoid cavity	M. Phalanges	R. Styloid process
D. Clavicle	I. Humerus	N. Radial tuberosity	S. Trochlea
E. Coracoid process	J. Metacarpals	O. Radius	T. Ulna
	1. Raised area on lat muscle attaches	teral surface of humerus to	which deltoid
	2. Arm bone		
	3	4. Bones composi	ng the shoulder girdle
	5	6. Forearm bones	
	7. Point where scap	ula and clavicle connect	
	8. Shoulder girdle bo	one that has no attachmen	t to the axial skeleton
	9. Shoulder girdle bo	one that articulates anterio	rly with the sternum
	10. Socket in the scap	oula for the arm bone	
	11. Process above the	glenoid cavity that permi	ts muscle attachment
	12. Commonly called	the collarbone	
	13. Distal medial proc	cess of the humerus; joins	the ulna
	14. Medial bone of th	e forearm in anatomical p	osition
	15. Rounded knob on	the humerus that articula	tes with the radius
		on; superior to the trochlea the forearm is flexed	; receives part
	17. Forearm bone inv	olved in formation of elbo	w joint
	18	19. Bones that artic	culate with the clavicle
	20. Bones of the wrist	t	
	21. Bones of the finge	ers	
	22. Heads of these bo	ones form the knuckles	

25. Figure 5–11 is a diagram of the articulated pelvis. Identify the bones and bone markings indicated by leader lines on the figure. Select different colors for the structures listed below and use them to color the coding circles and the corresponding structures in the figure. Also, label the dashed line showing the dimensions of the true pelvis and that showing the diameter of the false pelvis. Complete the illustration by labeling the following bone markings: obturator foramen, iliac crest, anterior superior iliac spine, ischial spine, pubic ramus, and pelvic brim. Last, list three ways in which the female pelvis differs from the male pelvis and insert your answers in the answer blanks.

Ocal bone	Pubic symphysis
Sacrum	 Acetabulum

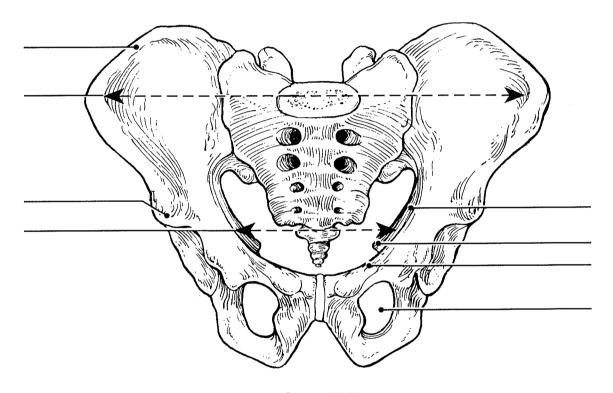

Figure 5-11

26. Circle the term that does not belong in each of the following groupings.

1.	Tibia	Ulna	Fibula	Femur	
2.	Skull	Rib cage	Vertebral co	olumn	Pelvis
3.	Ischium	Scapula	Ilium	Pubis	
4.	Mandible	Frontal bon	e Tempor	al bone	Occipital bone
5.	Calcaneus	Tarsals	Carpals	Talus	

27. Using the key choices, identify the bone names and markings, according to the descriptions that follow. Insert the appropriate key term(s) or letter(s) in the answer blanks.

Key Choices			
A. Acetabulum		I. Ilium	Q. Patella
B. Calcaneus		J. Ischial tuberosity	R. Pubic symphysis
C. Femur		K. Ischium	S. Pubis
D. Fibula		L. Lateral malleolus	T. Sacroiliac joint
E. Gluteal tuberosity		M. Lesser sciatic notch	U. Talus
F. Greater sciatic notch		N. Medial malleolus	V. Tarsals
G. Greater and lesser trocha	anters	O. Metatarsals	W. Tibia
H. Iliac crest		P. Obturator foramen	X. Tibial tuberosity
1	. Fuse to	form the coxal bone (hip bo	ne)
2	. Receives	the weight of the body whe	en sitting
3	. Point wł	nere the coxal bones join ant	eriorly
4	. Upper m	nargin of iliac bones	
5	. Deep so	cket in the hip bone that rece	ives the head of the thigh bone
6	. Point wh	nere the axial skeleton attach	es to the pelvic girdle
7	. Longest	bone in body; articulates wit	h the coxal bone
8	. Lateral b	one of the leg	
9	. Medial b	one of the leg	
10	. Bones fo	orming the knee joint	
11	. Point wh	nere the patellar ligament atta	aches
12	. Kneecap		
13	. Shinbone	5	
14	. Distal pr	ocess on medial tibial surface	e
15	. Process f	forming the outer ankle	

16. Heel bone

	17. Bones of the ankle
	18. Bones forming the instep of the foot
	19. Opening in a coxal bone formed by the pubic and ischial rami
	20. Sites of muscle attachment on the proximal end of the femur
	21. Tarsal bone that articulates with the tibia
28.	For each of the following statements that is true, insert T in the answer blank. If any of the statements are false, correct the <u>underlined</u> term by inserting the correct term in the answer blank.
	1. The <u>pectoral</u> girdle is formed by the articulation of the hip bones and the sacrum.
	2. Bones present in both the hand and the foot are <u>carpals</u> .
	3. The tough, fibrous connective tissue covering of a bone is the <u>periosteum</u> .
	4. The point of fusion of the three bones forming a coxal bone is the glenoid cavity.
	5. The large nerve that must be avoided when giving injections into the buttock muscles is the <u>femoral</u> nerve.
	6. The long bones of a fetus are constructed of <u>hyaline</u> cartilage.
	7. Bones that provide the most protection to the abdominal viscera are the <u>ribs</u> .
	8. The largest foramen in the skull is the <u>foramen magnum</u> .
	9. The intercondylar fossa, greater trochanter, and tibial tuberosity are all bone markings of the <u>humerus</u> .
	10. The first major event of fracture healing is hematoma formation.

29. The bones of the thigh and the leg are shown in Figure 5–12. Identify each and put your answers in the blanks labeled A, B, and C. Select different colors for the lower limb bones listed below and use them to color in the coding circles and corresponding bones on the diagram. Complete the illustration by inserting the terms indicating bone markings at the ends of the appropriate leader lines in the figure.

Femur Tibia Fibula

Head of femur Anterior border of tibia Head of fibula

Intercondylar eminence Lesser trochanter Medial malleolus

Tibial tuberosity Greater trochanter Lateral malleolus

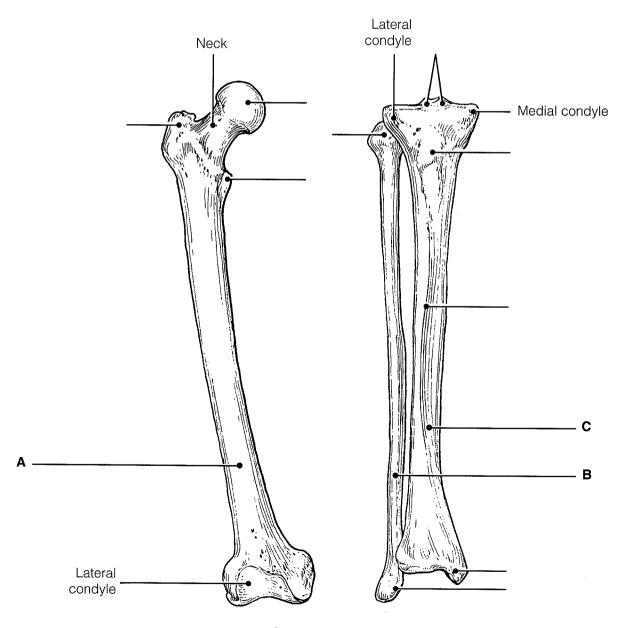

Figure 5-12

30. Figure 5–13 is a diagram of the articulated skeleton. Identify all bones or groups of bones by writing the correct labels at the end of the leader lines. Then, select two different colors for the bones of the axial and appendicular skeletons and use them to color in the coding circles and corresponding structures in the diagram.

Axial skeleton Appendicular skeleton

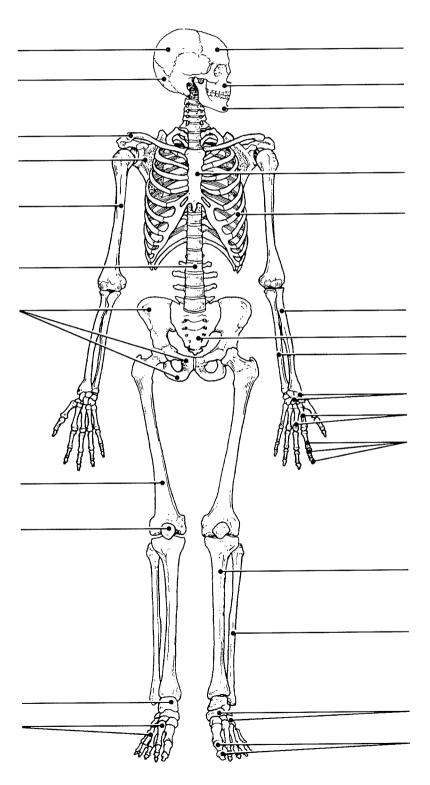

Figure 5-13

BONE FRACTURES

31. Using the key choices, identify the fracture (fx) types shown in Figure 5–14 and the fracture types and treatments described below. Enter the appropriate key letter or term in each answer blank.

Key Choices	
A. Closed reduction	D. Depressed fracture G. Simple fracture
B. Compression fracture	E. Greenstick fracture H. Spiral fracture
C. Compound fracture	F. Open reduction
	1. Bone is broken cleanly; the ends do not penetrate the skin
	2. Nonsurgical realignment of broken bone ends and splinting of bone
	3. A break common in children; bone splinters, but break is incomplete
	4. A fracture in which the bone is crushed; common in the vertebral column
	5. A fracture in which the bone ends penetrate through the skin surface
	6. Surgical realignment of broken bone ends
	7. A result of twisting forces

Figure 5-14

repair process, insert T in	tatements that is true about bone breakage and the the answer blank. For false statements, correct the ng the correct term in the answer blank.			
	1. A <u>hematoma</u> usually forms at a fracture site.			
	2. Deprived of nutrition, osteocytes at the fracture site die.			
	3. Nonbony debris at the fracture site is removed by osteoclasts.			
	4. Growth of a new capillary supply into the region produces granulation tissue.			
	5. Osteoblasts from the <u>medullary cavity</u> migrate to the fracture site.			
6. The <u>fibrocartilage callus</u> is the first repair mass to splin broken bone.				
	7. The bony callus is initially composed of compact bone.			
 33. Figure 5–15 shows the strujoint. Select different colors following areas and use the and the corresponding strucomplete the statements be Articular cartilage of be Fibrous capsule Synovial membrane Joint cavity 	s to identify each of the em to color the coding circles actures on the figure. Then, elow the figure.			
1.	The lubricant that minimizes friction and abrasion of joint surfaces is (1) .			
2				
3	(3)_, which reinforce the fibrous capsule, help to prevent dislocation of the joint.			

34. For each joint described below, select an answer from Key A. Then, if the Key A selection *is other than C* (a synovial joint), see if you can classify the joint further by making a choice from Key B.

Key A:	A. Cartilaginous	Key B: 1. Epiphyseal disk		
	B. Fibrous	2. Suture		
	C. Synovial	3. Symphysis		
	1	. Has amphiarthrotic and synarthrotic examples		
	2	. All have a fibrous capsule lined with synovial membrane surrounding a joint cavity		
	3	. Bone regions united by fibrous connective tissue		
	4	4. Joints between skull bones		
	5	. Joint between the atlas and axis

_12.

horizontal passageway joins with a vertical passage that runs with the longitudinal axis of the bone. This is obviously a __(7)_ canal. Because you would like to see how nutrients are brought into __(8)_ bone, you decide to follow this channel. Reasoning that there is no way you can possibly scale the slick walls of the channel, you leap and grab onto a white cord hanging down its length. Because it is easier to slide down than to try to climb up the cord, you begin to lower yourself, hand over hand. During your descent, you notice small openings in the wall, which are barely large enough for you to wriggle through. You conclude that these are the __(9)_ that connect all the __(10)_ to the nutrient supply in the central canal. You decide to investigate one of these tiny

openings and begin to swing on your cord, trying to get a foothold on one of the openings. After managing to anchor yourself and squeezing into an opening, you use a flashlight to illuminate the passageway in front of you. You are startled by a giant cell with many dark nuclei. It appears to be plastered around the entire lumen directly ahead of you. As you watch this cell, the bony material beneath it, the (11), begins to liquefy. The cell apparently is a bone-digesting cell, or (12), and because you are unsure whether or not its enzymes can also liquefy you, you slither backwards hurriedly and begin your trek back to your retrieval site.

AT THE CLINIC

- **40.** Antonio is hit in the face with a football during practice. An X ray reveals multiple fractures of the bones around an orbit. Name the bones that form margins of the orbit.
- **41.** Mrs. Bruso, a woman in her 80s, is brought to the clinic with a fractured hip. X rays reveal compression fractures in her lower vertebral column and extremely low bone density in her vertebrae, hip bones, and femurs. What are the condition, cause, and treatment?
- **42.** Jack, a young man, is treated at the clinic for an accident in which he hit his forehead. When he returns for a checkup, he complains that he can't smell anything. A hurried X ray of his head reveals a fracture. What part of which bone was fractured to cause his loss of smell?

43. A middle-aged woman comes to the clinic complaining of stiff, painful joints and increasing immobility of her finger joints. A glance at her hands reveals knobby, deformed knuckles. For what condition will she be tested?

44. At his 94th birthday party, James was complimented on how good he looked and was asked about his health. He replied, "I feel good most of the time, but some of my joints ache and are stiff, especially my knees, hips, and lower back, and especially in the morning when I wake up." A series of X rays and an MRI scan taken a few weeks earlier had revealed that the articular cartilages of these joints were rough and flaking off, and bone spurs (overgrowths) were present at the ends of some of James's bones. What is James's probable condition?

45. Janet, a 10-year-old girl, is brought to the clinic after falling out of a tree. An X ray shows she has small fractures of the transverse processes of T_3 to T_5 on the right side. Janet will be watched for what abnormal spinal curvature over the next several years?

46. The serving arm of many tennis players is often significantly larger (thicker) than the other arm. Explain this phenomenon.

47. Jerry is giving cardiopulmonary resuscitation to Ms. Jackson, an elderly woman who has just been rescued from the waters of Cape Cod Bay. What bone is he compressing?

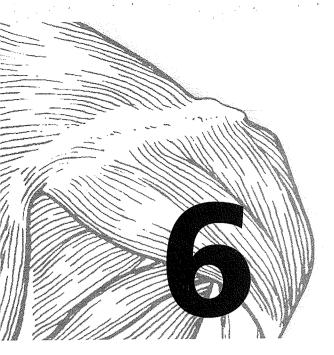

🕜 THE FINALE: MULTIPLE CHOICE

- 48. Select the best answer or answers from the choices given.
 - 1. Important bone functions include:
 - A. support of the pelvic organs
 - B. protection of the brain
 - C. providing levers for movement of the
 - D. protection of the skin and limb musculature
 - E. storage of water
 - 2. A passageway connecting neighboring osteocytes in an osteon is a:
 - A. central canal
- D. canaliculus
- B. lamella
- E. perforating canal
- C. lacuna
- 3. What is the earliest event (of those listed) in endochondral ossification?
 - A. Ossification of proximal epiphysis
 - B. Appearance of the epiphyseal plate
 - C. Invasion of the shaft by the periosteal bud
 - D. Cavitation of the cartilage shaft
 - E. Formation of secondary ossification
- 4. The growth spurt of puberty is triggered by:
 - A. high levels of sex hormones
 - B. the initial, low levels of sex hormones
 - C. growth hormone
 - D. parathyroid hormone
 - E. calcitonin
- 5. Deficiency of which of the following hormones will cause dwarfism?
 - A. Growth hormone
 - B. Sex hormones
 - C. Thyroid hormones
 - D. Calcitonin
 - E. Parathyroid hormone

- 6. Women suffering from osteoporosis are frequent victims of fractures of the vertebrae.
 - A. compound
- D. compression
- B. spiral
- E. depression
- C. comminuted
- 7. Which of the following bones are part of the axial skeleton?
 - A. Vomer
- D. Parietal
- B. Clavicle
- E. Coxal bone
- C. Sternum
- 8. A blow to the cheek is most likely to break what superficial bone or bone part?
 - A. Superciliary arches
 - B. Zygomatic process
 - C. Mandibular ramus
 - D. Styloid process
- 9. Which of the following are part of the sphenoid?
 - A. Crista galli
- D. Pterygoid process
- B. Sella turcica
- E. Lesser wings
- C. Petrous portion
- 10. Structural characteristics of all cervical vertebrae are:
 - A. small body
 - B. bifid spinous process
 - C. transverse foramina
 - D. small vertebral foramen
 - E. costal facets
- 11. Which of the following bones exhibit a styloid process?
 - A. Hyoid
- D. Radius
- B. Temporal
- E. Ulna
- C. Humerus

- 12. Hip bone markings include:
 - A. ala
- D. pubic ramus
- B. sacral hiatus
- E. fovea capitis
- C. gluteal surface
- 13. Cartilaginous joints include:
 - A. syndesmoses
- C. synostoses
- B. symphyses
- D. synchondroses
- 14. Considered to be part of a synovial joint are:
 - A. bursae
- C. tendon sheath
- B. articular cartilage D. capsular
 - D. capsular ligaments
- 15. Abduction is:
 - A. moving the right arm out to the right
 - B. spreading out the fingers
 - C. wiggling the toes
 - D. moving the sole of the foot laterally
- 16. In comparing two joints of the same type, what characteristic(s) would you use to determine strength and flexibility?
 - A. Depth of the depression of the concave bone of the joint
 - B. Snugness of fit of the bones
 - C. Size of bone projections for muscle attachments
 - D. Presence of menisci

- 17. Which of the following joints has the greatest freedom of movement?
 - A. Interphalangeal
 - B. Saddle joint of thumb
 - C. Distal tibiofibular
 - D. Coxal
- 18. Which specific joint does the following description identify? "Articular surfaces are deep and secure, multiaxial; capsule heavily reinforced by ligaments; labrum helps prevent dislocation; the first joint to be built artificially; very stable."
 - A. Elbow
- C. Knee
- B. Hip
- D. Shoulder
- 19. An autoimmune disease resulting in inflammation and eventual fusion of diarthrotic joints is:
 - A. gout
 - B. rheumatoid arthritis
 - C. degenerative joint disease
 - D. pannus
- 20. Plane joints allow:
 - A. pronation
- C. rotation
- B. flexion
- D. gliding

THE MUSCULAR SYSTEM

Muscles, the specialized tissues that facilitate body movement, make up about 40% of body weight. Most body muscle is the voluntary type, called skeletal muscle because it is attached to the bony skeleton. Skeletal muscle contributes to body contours and shape, and it composes the organ system called the muscular system. These muscles allow you to grin, frown, run, swim, shake hands, swing a hammer, and to otherwise manipulate your environment. The balance of body muscle is smooth and cardiac muscles, which form the bulk of the walls of hollow organs and the heart. Smooth and cardiac muscles are involved in the transport of materials within the body.

Study activities in this chapter deal with microscopic and gross structure of muscle, identification of voluntary muscles, body movements, and important understandings of muscle physiology.

OVERVIEW OF MUSCLE TISSUES

1. Nine characteristics of muscle tissue are listed below and on page 104. Identify the muscle tissue type described by choosing the correct response(s) from the key choices. Enter the appropriate term(s) or letter(s) of the key choice in the answer blank.

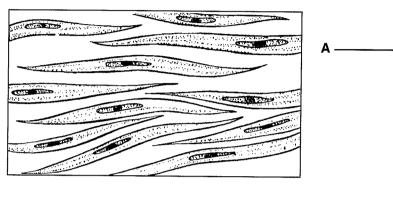

Key Choices

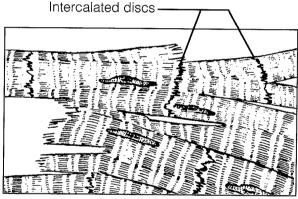

A. Cardiac	B. Smooth	C. Skeletal
	1. Involu	untary
	2. Bande	ed appearance
	3. Longit	itudinally and circularly arranged layers
	4. Dense	e connective tissue packaging
	5. Figure	e-8 packaging of the cells
	6. Coord	dinated activity to act as a pump

8. Referred to as the muscular system

______ 9. Voluntary

2. Identify the type of muscle in each of the illustrations in Figure 6–1. Color the diagrams as you wish.

В _____

Figure 6-1

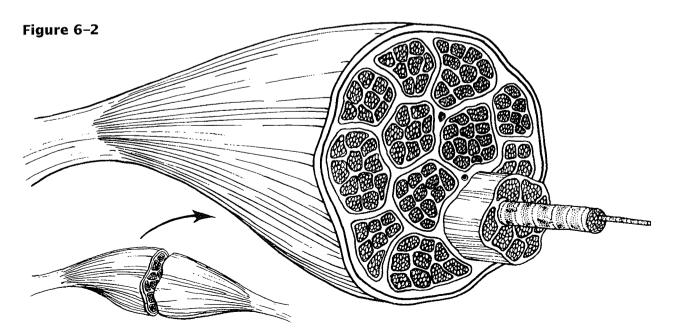

3. Regarding the functions of muscle tissues, circle the term in each of the groupings that does not belong with the other terms.

1.	Urine	Foodstuffs	Bones	Smoo	th musc	le
2.	Heart	Cardiac muscle	Blood p	ump	Promot	tes labor during birth
3.	Excitability	Response to a sti	mulus	Contractili	ty	Action potential
4.	Ability to shor	ten Contract	ility	Pulls on b	ones	Stretchability
5.	Maintains post	ture Movem	ent	Promotes g	growth	Generates heat

MICROSCOPIC ANATOMY OF SKELETAL MUSCLE

4. First, identify the structures in Column B by matching them with the descriptions in Column A. Enter the correct letters (or terms if desired) in the answer blanks. Then, select a different color for each of the terms in Column B that has a color-coding circle and color in the structures on Figure 6–2.

C	column A	Column b
1	. Connective tissue surrounding a fascicle	A. Endomysium
2	. Connective tissue ensheathing the entire	B. Epimysium 🔘
	muscle	C. Fascicle
3	. Contractile unit of muscle	D. Fiber 🔘
4	. A muscle cell	E. Myofilament
5	Thin connective tissue investing each	F. Myofibril 🔘
	muscle cell	G. Perimysium
6	6. Plasma membrane of the muscle cell	H. Sarcolemma
	7. A long, filamentous organelle found within muscle cells that has a banded	I. Sarcomere
	appearance	J. Sarcoplasm
8	3. Actin- or myosin-containing structure	K. Tendon
	O. Cordlike extension of connective tissue beyond the muscle, serving to attach it to the bone	
10). A discrete bundle of muscle cells	

- **5.** Figure 6–3 is a diagrammatic representation of a small portion of a relaxed muscle cell (bracket indicates the portion enlarged). First, select different colors for the structures listed below. Use them to color the coding circles and corresponding structures on Figure 6–3. Then bracket and label an A band, an I band, and a sarcomere. When you have finished, draw a contracted sarcomere in the space beneath the figure and label the same structures, as well as the light and dark bands.
 - Myosin Actin filaments Z disc

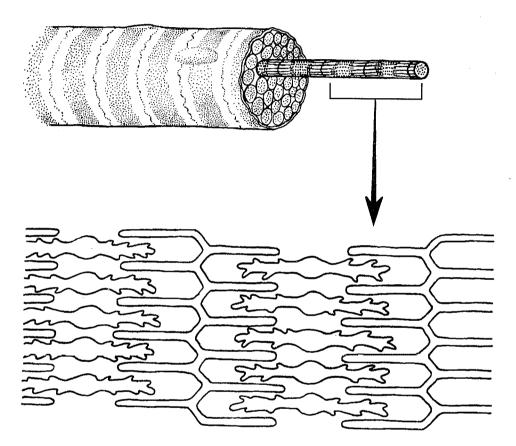

Figure 6-3

^{1.} Looking at your diagram of a contracted sarcomere from a slightly different angle, which region of the sarcomere shortens during contraction—the dark band, the light band, or both?

Sarcomere

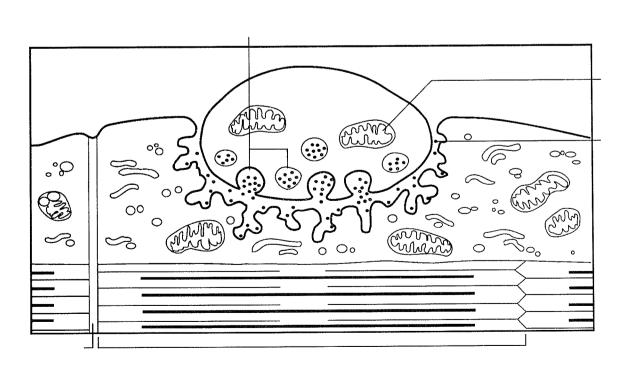

SKELETAL MUSCLE ACTIVITY

label appropriately.

Mitochondrion

Synaptic vesicles

1.	A motor neuron and all of the skeletal muscle cells it stimulates is called a <u>(1)</u> . The axon of each motor neuron
 2.	has numerous endings called <u>(2)</u> . The actual gap between an axonal ending and the muscle cell is called a <u>(3)</u> .
3.	Within the axonal endings are many small vesicles containing a neurotransmitter substance called <u>(4)</u> .
4.	When the <u>(5)</u> reaches the ends of the axon, the neurotransmitter is released, and it diffuses to the muscle cell membrane to combine with receptors there. Binding of the neurotrans-
6.	mitters with muscle membrane receptors causes the membrane to become permeable to sodium, resulting in the influx of sodium ions and <u>(6)</u> of the membrane. Then contraction of the muscle cell occurs.

		the following occur within a \checkmark) by the correct choices.	muscle ce	ll during oxygen debt? Place
		1. Decreased ATP		5. Increased oxygen
		2. Increased ATP		6. Decreased carbon dioxide
		3. Increased lactic acid		7. Increased carbon dioxide
		4. Decreased oxygen		8. Increased glucose

MUSCLE MOVEMENTS, TYPES, AND NAMES

14. Relative to general terminology concerning muscle activity, first label the following structures on Figure 6–5: insertion, origin, tendon, resting muscle, and contracting muscle. Next, identify the two structures named below by choosing different colors for the coding circles and the corresponding structures in the figure.

() Movable bone

() Immovable bone

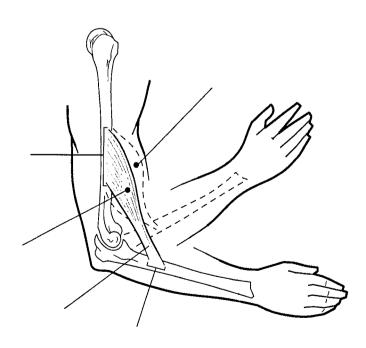

Figure 6-5

15.	Complete the follow	ving stateme	ents. Insert your answers in the answer blanks.
		1.	Standing on your toes as in ballet is (1) of the foot. Walking on your heels is (2) .
		2. 3.	Winding up for a pitch (as in baseball) can properly be called(3) To keep your seat when riding a horse, the tendency is to(4) _ your thighs.
			In running, the action at the hip joint is(5)_ in reference to the leg moving forward and(6)_ in reference to the leg in the posterior position. When kicking a football, the action at the knee is(7) In climbing stairs, the hip and knee of the forward leg are both(8) You have just touched your chin to your chest; this is(9)_ of the neck.
		9.	Using a screwdriver with a straight arm requires <u>(10)</u> of the arm. Consider all the movements of which the arm is capable. One often used for strengthening all the upper arm and shoulder muscles is <u>(11)</u> .
		10. 11. 12.	Moving the head to signify "no" is $\underline{(12)}$. Action that moves the distal end of the radius across the ulna is $\underline{(13)}$. Raising the arms laterally away from the body is called $\underline{(14)}$ of the arms.
		13. 14.	
16.	muscles interact wit	th other mu	are often used to describe the manner in which scles. Select the key terms that apply to the the correct letter or term in the answer blanks.
	Key Choices		
	A. Antagonist	B. Fixato	r C. Prime mover D. Synergist
		1. A	gonist
		2. P	ostural muscles for the most part
			tabilizes a joint so that the prime mover can act at more istal joints
		4. P	erforms the same movement as the prime mover
		5. R	everses and/or opposes the action of a prime mover
		6. I1	mmobilizes the origin of a prime mover

17. Several criteria are applied to the naming of muscles. These are provided in Column B. Identify which criteria pertain to the muscles listed in Column A and enter the correct letter(s) in the answer blank.

	Column A	Column B
	1. Gluteus maximus	A. Action of the muscle
	2. Adductor magnus	B. Shape of the muscle
<u> </u>	3. Biceps femoris	C. Location of the muscle's origin and/or insertion
	4. Transversus abdominis	D. Number of origins
	5. Extensor carpi ulnaris	E. Location of muscle relative to a bone or body region
	6. Trapezius	F. Direction in which the muscle fibers run relative to
***************************************	7. Rectus femoris	some imaginary line
	8. External oblique	G. Relative size of the muscle

GROSS ANATOMY OF THE SKELETAL MUSCLES Muscles of the Head

18. Identify the major muscles described in Column A by choosing a response from Column B. Enter the correct letter in the answer blank. Select a different color for each muscle described and color in the coding circle and corresponding muscle on Figure 6–6.

	Column A	Column B
O	1. Used in smiling	A. Buccinator
O	2. Used to suck in your cheeks	B. Frontalis
O	3. Used in winking	C. Masseter
O	4. Used to form the horizontal frown crease on the forehead	D. Orbicularis oculi
O	5. The "kissing" muscle	E. Orbicularis oris
O	6. Prime mover of jaw closure	F. Sternocleidomastoid
O	7. Synergist muscle for jaw closure	G. Temporalis
O	8. Prime mover of head flexion; a two-headed	H. Trapezius
_	muscle	I. Zygomaticus

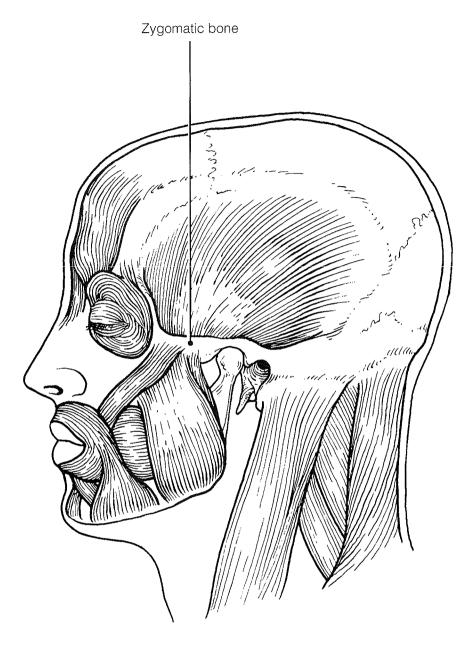

Figure 6-6

accomplish inspiration

Muscles of the Trunk

19. Identify the anterior trunk muscles described in Column A by choosing a response from Column B. Enter the correct letter in the answer blank. Then, for each muscle description that has a color-coding circle, select a different color to color the coding circle and corresponding muscle on Figure 6–7.

	Column A	Column B
O	1. The name means "straight muscle of the abdomen"	A. Deltoid
	2. Prime mover for shoulder flexion and	B. Diaphragm
	adduction	C. External intercostal
\bigcirc	3. Prime mover for shoulder abduction	D. External oblique
O	4. Part of the abdominal girdle; forms the	E. Internal intercostal
	external lateral walls of the abdomen	F. Internal oblique
O	Acting alone, each muscle of this pair turns the head toward the opposite shoulder	G. Latissimus dorsi
	6. and 7. Besides the two abdominal muscles	H. Pectoralis major
	(pairs) named above, two muscle pairs that help form the natural abdominal girdle	I. Rectus abdominis
	8. Deep muscles of the thorax that promote	J. Sternocleidomastoid
	the inspiratory phase of breathing	K. Transversus abdominis
	9. An unpaired muscle that acts with the muscles named immediately above to	

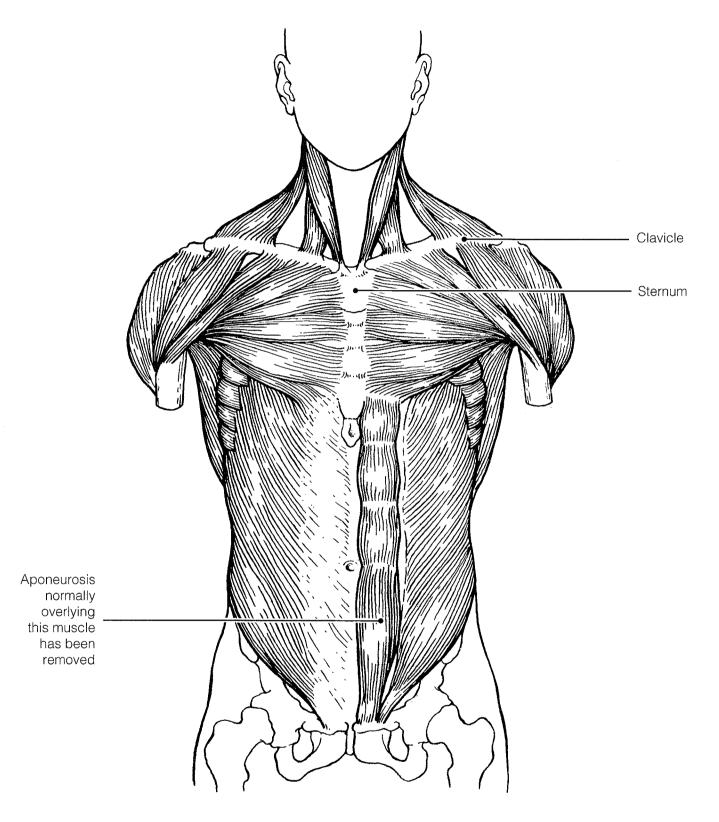

Figure 6-7

20. Identify the posterior trunk muscles described in Column A by choosing a response from Column B. Enter the correct letter in the answer blank. Select a different color for each muscle description with a coding circle and color the coding circles and corresponding muscles on Figure 6-8.

	Column A	Column B
O	Muscle that allows you to shrug your shoulders or extend your head	A. Deltoid
	·	B. Erector spinae
<u> </u>	2. Muscle that adducts the shoulder and causes extension of the shoulder joint	C. External oblique
O	3. Shoulder muscle that is the antagonist of the	D. Gluteus maximus
	muscle just described	E. Latissimus dorsi
	4. Prime mover of back extension; a deep composite muscle consisting of three columns	F. Quadratus lumborum
	5. Large paired superficial muscle of the lower back	G. Trapezius
O	6. Fleshy muscle forming part of the posterior abdominal wall that helps maintain upright posture	

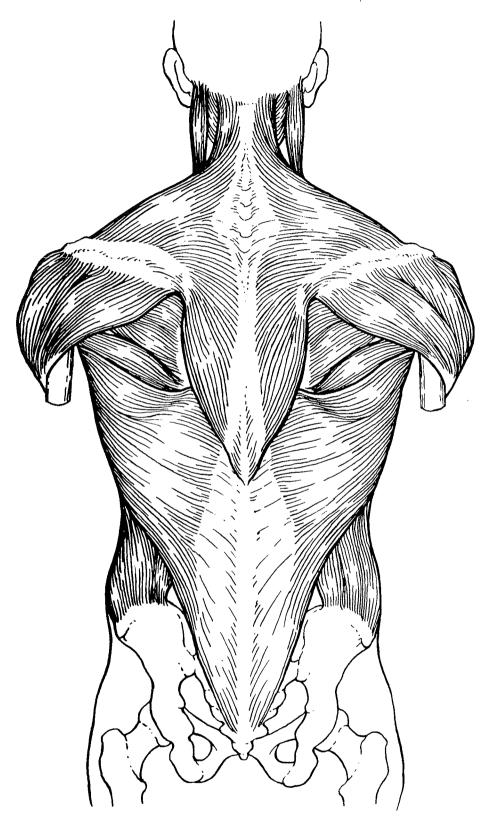

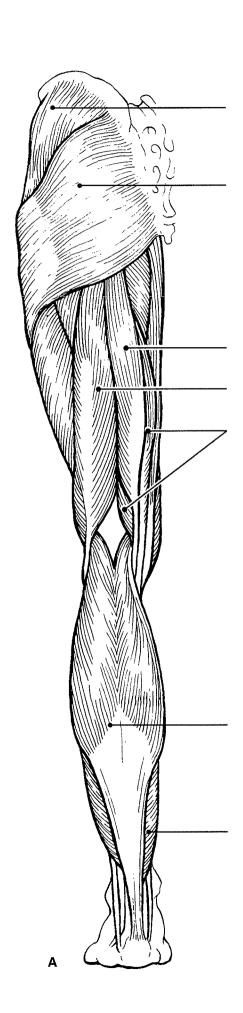

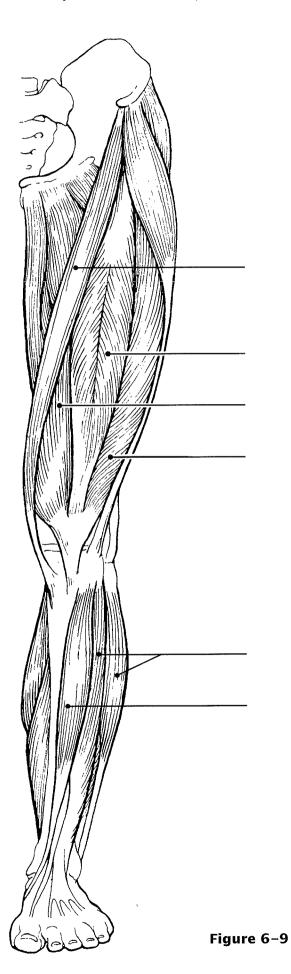

Figure 6-8

Muscles of the Hip, Thigh, and Leg

21. Identify the muscles described in Column A by choosing a response from Column B. Enter the correct letter in the answer blank. Select a different color for each muscle description provided with a color-coding circle, and use it to color the coding circles and corresponding muscles on Figure 6–9. Complete the illustration by labeling those muscles provided with leader lines.

Column			CC	Jiumn B
	•	deep in pelvis; a composite	A.	Adductors

DEVELOPMENTAL ASPECTS OF THE MUSCULAR SYSTEM

 _	The first movement of the baby detected by the mother-to-be is called the $\underline{\hspace{0.1cm}}(1)$.
	An important congenital muscular disease that results in the degeneration of the skeletal muscles by young adulthood is called (2).
	A baby's control over muscles progresses in a <u>(3)</u> direction as well as a <u>(4)</u> direction. In addition, <u>(5)</u> muscular control (that is, waving of the arms) occurs before <u>(6)</u> control
	(pincer grasp) does. Muscles will ordinarily stay healthy if they are(7)_ regularly
	without normal stimulation they <u>(8)</u> . <u>(9)</u> is a disease of the muscles, which results from some problem with the stimulation of muscles by acetylcholine. The
	muscles become progressively weaker in this disease. With age, our skeletal muscles decrease in mass; this leads to
 11. 12.	a decrease in body <u>(10)</u> and in muscle <u>(11)</u> . Muscle tissue that is lost is replaced by noncontractile <u>(12)</u> tissue.

INCREDIBLE JOURNEY

${\it A\ Visualization\ Exercise\ for\ the\ Muscular\ System}$

As you straddle this structure, you wonder what is happening.

28. Where necessary, complete statements by inserting the missing words in the numbered spaces.		
journey will begin when you see the muscle cell. Once injected, you more	On this incredible journey, you will be miniaturized and enter a skeletal muscle cell to observe the events that occur during muscle contraction. You prepare yourself by donning a wet Then you climb into a syringe to prepare for injection. Your e gleaming connective tissue covering, the(1)_ of a single lator your descent through the epidermis and subcutaneous tisll surface, you see that it is punctuated with pits at relatively

	_ 3.
	_ 4.
	_ 5.
	_ 6.
	_ 8.
	_ 9.
	10

regular intervals. Looking into the darkness and off in the distance, you can see a leash of fibers ending close to a number of muscle cells. Considering that all of these fibers must be from the same motor neuron, this functional unit is obviously a (2). You approach the fiber ending on your muscle cell and scrutinize the (3) junction there. As you examine the junction, minute fluid droplets leave the nerve ending and attach to doughnut-shaped receptors on the muscle cell membrane. This substance released by the nerve ending must be (4). Then, as a glow falls over the landscape, your ion detector indicates ions are disappearing from the muscle cell exterior and entering the muscle pits. The needle drops from high to low as the (5) ions enter the pits from the watery fluid outside. You should have expected this, because these ions must enter to depolarize the muscle cells and start the (6) .

Next, you begin to explore one of the surface pits. As the muscle jerks into action, you topple deep into the pit.

Sparkling electricity lights up the wall on all sides. You grasp for a handhold. Finally successful, you pull yourself laterally into the interior of the muscle cell and walk carefully along what seems to be a log. Then, once again, you notice an eerie glow as your ion detector reports that __(7)_ ions are entering the cytoplasm rapidly. The "log" you are walking on "comes to life" and begins to slide briskly in one direction. Unable to keep your balance, you fall. As you straddle this structure, you wonder what is happening. On all sides, cylindrical structures—such as the one you are astride—are moving past other similar but larger structures. Suddenly you remember, these are the __(8)_ myofilaments that slide past the __(9)_ myofilaments during muscle contraction.

Seconds later, the forward movement ends, and you begin to journey smoothly in the opposite direction. The ion detector now indicates low (10) ion levels. Because you cannot ascend the smooth walls of one of the entry pits, you climb from one myofilament to another to reach the underside of the sarcolemma. Then you travel laterally to enter a pit close to the surface and climb out onto the cell surface. Your journey is completed, and you prepare to leave your host once again.

AT THE CLINIC

29. Pete, who has been moving furniture all day, arrives at the clinic complaining of painful spasms in his back. He reports having picked up a heavy table by stooping over. What muscle group has Pete probably strained, and why are these muscles at risk when one lifts objects improperly?

- Anatomy & Physiology Coloring Workbook 30. During an overambitious workout, a high school athlete pulled some muscles by forcing his knee into extension when his hip is already fully flexed. What muscles did he pull? 31. An emergency appendectomy is performed on Mr. Geiger. The incision was made at the lateral edge of the right iliac abdominopelvic region. Was his rectus abdominis cut? 32. Susan, a massage therapist, was giving Mr. Graves a back rub. What two broad superficial muscles of the back were receiving the "bulk" of her attention? 33. Mrs. Sanchez says that her 6-year-old son seems to be unusually clumsy and tires easily. The doctor notices that his calf muscles appear to be normal in size. If anything, they seem a bit enlarged rather than wasted. For what condition must the boy be checked? What is the prognosis? **34.** People with chronic back pain occasionally get relief from a tummy tuck. How does this help?
- 35. Gregor, who works at a pesticide factory, comes to the clinic complaining of muscle spasms that interfere with his movement and breathing. A blood test shows that he has been contaminated with organophosphate pesticide, which is an acetylcholinesterase inhibitor. How would you explain to Gregor what this means?

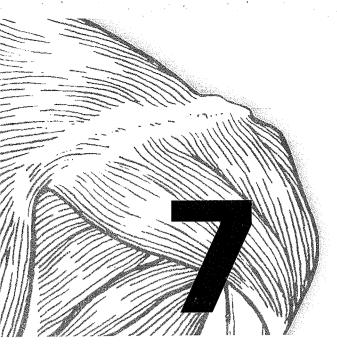

THE FINALE: MULTIPLE CHOICE

- 36. Select the best answer or answers from the choices given.
 - 1. Select the type(s) of muscle tissue that fit the following description: self-excitable, pacemaker cells, gap junctions, limited sarcoplasmic reticulum.
 - A. Skeletal muscle
- C. Smooth muscle
- B. Cardiac muscle
- D. Involuntary muscle
- 2. Skeletal muscle is not involved in:
 - A. movement of skin
 - B. propulsion of a substance through a body tube
 - C. heat production
 - D. inhibition of body movement
- 3. Which of the following are part of a thin myofilament?
 - A. ATP-binding site
- C. Globular actin
- B. Regulatory proteins
- D. Calcium
- 4. Detachment of the cross bridges is directly triggered by:
 - A. hydrolysis of ATP
 - B. repolarization of the T tubules
 - C. the power stroke
 - D. attachment of ATP to myosin heads
- 5. Transmission of the stimulus at the neuromuscular junction involves:
 - A. synaptic vesicles
- C. ACh
- B. sarcolemma
- D. axon terminal
- 6. Your ability to lift that heavy couch would be increased by which type of exercise?
 - A. Aerobic
- C. Resistance
- B. Endurance
- D. Swimming

- 7. Which of the following activities depends most on anaerobic metabolism?
 - A. Jogging
 - B. Swimming a race
 - C. Sprinting
 - D. Running a marathon
- 8. The first energy source used to regenerate ATP when muscles are extremely active is:
 - A. fatty acids
- C. creatine phosphate
- B. glucose
- D. pyruvic acid
- 9. Head muscles that insert on a bone include the:
 - A. zygomaticus
- C. buccinator
- B. masseter
- D. temporalis
- 10. Lateral flexion of the torso involves:
 - A. erector spinae
 - B. rectus abdominis
 - C. quadratus lumborum
 - D. external oblique
- 11. Muscles attached to the vertebral column include:
 - A. quadratus lumborum
 - B. external oblique
 - C. diaphragm
 - D. latissimus dorsi
- 12. Muscles that help stabilize the scapula and shoulder joint include:
 - A. triceps brachii
- C. trapezius
- B. biceps brachii
- D. rhomboids

- 13. Which of these thigh muscles causes movement at the hip joint?
 - A. Rectus femoris
- C. Vastus lateralis
- B. Biceps femoris
- D. Semitendinosus
- 14. Leg muscles that can cause movement at the knee joint include:
 - A. tibialis anterior
- C. gastrocnemius
- B. fibularis longus
- D. soleus
- 15. The main muscles used when doing chinups are:
 - A. triceps brachii and pectoralis major
 - B. infraspinatus and biceps brachii
 - C. serratus anterior and external oblique
 - D. latissimus dorsi and brachialis
- 16. The major muscles used in doing push-ups are:
 - A. biceps brachii and brachialis
 - B. supraspinatus and subscapularis
 - C. coracobrachialis and latissimus dorsi
 - D. triceps brachii and pectoralis major

- 17. Arm and leg muscles are arranged in antagonistic pairs. How does this affect their functioning?
 - A. It provides a backup if one of the muscles is injured.
 - B. One muscle of the pair pushes while the other pulls.
 - C. A single neuron controls both of them.
 - D. It allows the muscles to produce opposing movements.
- 18. Muscle A and muscle B are the same size, but muscle A is capable of much finer control than muscle B. Which of the following is likely to be true of muscle A?
 - A. It is controlled by more neurons than muscle B.
 - B. It contains fewer motor units than muscle B.
 - C. It is controlled by fewer neurons than muscle B.
 - D. Each of its motor units consists of more cells than the motor units of muscle B.

THE NERVOUS SYSTEM

The nervous system is the master coordinating system of the body. Every thought, action, and sensation reflects its activity. The structures of the nervous system are described in terms of two principal divisions—the central nervous system (CNS) and the peripheral nervous system (PNS). The CNS (brain and spinal cord) interprets incoming sensory information and issues instructions based on past experience. The PNS (cranial and spinal nerves and ganglia) provides the communication lines between the CNS and the body's muscles, glands, and sensory receptors. The nervous system is also divided functionally in terms of motor activities into the somatic and autonomic divisions. It is important, however, to recognize that these classifications are made for the sake of convenience and that the nervous system acts in an integrated manner both structurally and functionally.

Student activities provided in this chapter review neuron anatomy and physiology, identify the various structures of the central and peripheral nervous system, consider reflex and sensory physiology, and summarize autonomic nervous system anatomy and physiology. Because every body system is controlled, at least in part, by the nervous system, these understandings are extremely important to understanding how the body functions as a whole.

1. Lis	t the three major functions of the nervous system.
1.	
2.	
2	
3.	

ORGANIZATION OF THE NERVOUS SYSTEM

2. Choose the key responses that best correspond to the descriptions provided in the following statements. Insert the appropriate letter or term in the answer blanks. Key Choices A. Autonomic nervous system C. Peripheral nervous system (PNS) B. Central nervous system (CNS) D. Somatic nervous system 1. Nervous system subdivision that is composed of the brain and spinal cord 2. Subdivision of the PNS that controls voluntary activities such as the activation of skeletal muscles 3. Nervous system subdivision that is composed of the cranial and spinal nerves and ganglia 4. Subdivision of the PNS that regulates the activity of the heart and smooth muscle, and of glands; it is also called the involuntary nervous system 5. A major subdivision of the nervous system that interprets incoming information and issues orders 6. A major subdivision of the nervous system that serves as communication lines, linking all parts of the body to the CNS **NERVOUS TISSUE—STRUCTURE AND FUNCTION** 3. This exercise emphasizes the difference between neurons and neuroglia. Indicate which cell type is identified by the following descriptions. Insert the appropriate letter or term in the answer blanks. Key Choices A. Neurons B. Neuroglia ____ 1. Support, insulate, and protect cells 2. Demonstrate irritability and conductivity, and thus transmit electrical messages from one area of the body to another area 3. Release neurotransmitters 4. Are amitotic

5. Able to divide; therefore are responsible for most brain neoplasms

4. Relative to neuron anatomy, match the anatomical terms given in Column B

6. Using the key choices, select the terms identified in the following descriptions by inserting the appropriate letter or term in the spaces provided.

Key Choices				
A. Afferent neuron	F. Neuroglia	K. Proprioceptors		
B. Association neuron (or interneuron)	G. Neurotransmitters	L. Schwann cells		
C. Cutaneous sense organ	s H. Nerve	M. Synapse		
D. Efferent neuron	I. Nodes of Ranvier	N. Stimuli		
E. Ganglion	J. Nuclei	O. Tract		
	1. Sensory receptors found in to detect temperature, pre	n the skin, which are specialized essure changes, and pain		
	2. Specialized cells that myelinate the fibers of neurons found in the PNS			
	3. Junction or point of close contact between neurons			
	4. Bundle of nerve processes inside the CNS			
	5. Neuron, serving as part of the conduction pathway between sensory and motor neurons			
	6. Gaps in a myelin sheath			
	7. Collection of nerve cell bo	odies found outside the CNS		
	8. Neuron that conducts imp and glands	ulses away from the CNS to muscle		
	9. Sensory receptors found ir their degree of stretch	n muscle and tendons that detect		
1	0. Changes, occurring within	or outside the body, that affect		

nervous system functioning

periphery

muscles, or glands

11. Neuron that conducts impulses toward the CNS from the body

12. Chemicals released by neurons that stimulate other neurons,

structures listed below and use them to color in the coding circles and corresponding structures in the illustration. Next, circle the term in the list of three terms to the left of the diagram that best describes this neuron's structural class. Finally, draw arrows on the figure to indicate the direction of impulse transmission along the neuron's membrane. Axon Dendrites Cell body Myelin sheath

1. Stimulus 4	
2 5. Effector organ	

9.	Using the key choices, Place the correct term of	•	ed in the following statements. answer blanks.
	Key Choices		
	A. Action potential	D. Potassium ions	G. Sodium ions
	B. Depolarization	E. Refractory period	H. Sodium-potassium pump
	C. Polarized	F. Repolarization	
		_ 1. Period of repolarize respond to a second	zation of the neuron during which it cannot nd stimulus
		_ 2. State in which the rush into the neur	resting potential is reversed as sodium ions on
		3. Electrical condition	n of the plasma membrane of a resting neuron
		_ 4. Period during whi	ch potassium ions diffuse out of the neuron
		_ 5. Transmission of the membrane	e depolarization wave along the neuron's
		_ 6. The chief positive	intracellular ion in a resting neuron
		•	ATP is used to move sodium ions out of the ions back into the cell; completely restores ons of the neuron
10.	Using the key choices, i following situations.	dentify the types of refle	exes involved in each of the
	Key Choices		
	A. Somatic reflex(es)	B. Autonomic refle	ex(es)
		_ 1. Patellar (knee-jerk) reflex
		_ 2. Pupillary light refle	ex
		_ 3. Effectors are skele	tal muscles
		_ 4. Effectors are smoo	th muscle and glands
		_ 5. Flexor reflex	
		_ 6. Regulation of bloc	od pressure

7. Salivary reflex

11. Refer to Figure 7–2, showing a reflex arc, as you complete this exercise. First, briefly answer the following questions by inserting your responses in the spaces provided. 1. What is the stimulus? 2. What tissue is the effector? 3. How many synapses occur in this reflex arc? Next, select different colors for each of the following structures and use them to color in the coding circles and corresponding structures in the diagram. Finally, draw arrows on the figure indicating the direction of impulse transmission through this reflex pathway. Receptor region Interneuron Afferent neuron Efferent neuron Effector

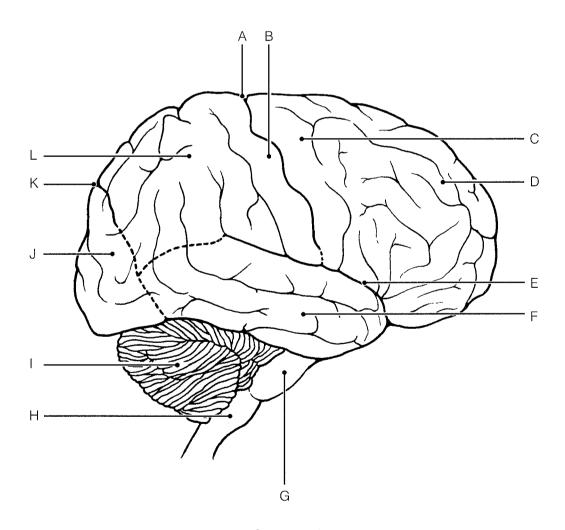

Figure 7-3

8. Fourth ventricle

17. Figure 7–4 is a diagram of the sagittal view of the human brain. First, match the letters on the diagram with the following list of terms and insert the appropriate letter in each answer blank. Then, color the brain-stem areas blue and the areas where cerebrospinal fluid is found yellow.

 1.	Cerebellum	 9.	Mammillary body
 2.	Cerebral aqueduct	 10.	Medulla oblongata
 3.	Cerebral hemisphere	 11.	Optic chiasma
 4.	Cerebral peduncle	 12.	Pineal body
 5.	Choroid plexus	 13.	Pituitary gland
 6.	Corpora quadrigemina	 14.	Pons
 7.	Corpus callosum	 15.	Thalamus

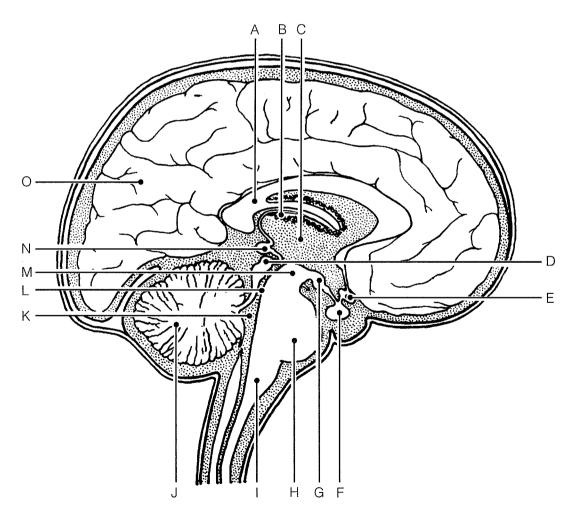

Figure 7-4

	eas listed in Exercise 17, match the appropriate following descriptions. Insert the correct terms
	_ 1. Site of regulation of water balance and body temperature
	2. Contains reflex centers involved in regulating respiratory rhythm in conjunction with lower brain-stem centers
	_ 3. Responsible for the regulation of posture and coordination of skeletal muscle movements
	4. Important relay station for afferent fibers traveling to the sensory cortex for interpretation
	_ 5. Contains autonomic centers, which regulate blood pressure and respiratory rhythm, as well as coughing and sneezing centers
	_ 6. Large fiber tract connecting the cerebral hemispheres
	_ 7. Connects the third and fourth ventricles
	_ 8. Encloses the third ventricle
	_ 9. Forms the cerebrospinal fluid
	_ 10. Midbrain area that is largely fiber tracts; bulges anteriorly
	_ 11. Part of the limbic system; contains centers for many drives (rage, pleasure, hunger, sex, etc.)
	orain structures consist of gray matter; others are for gray) or W (for white) as appropriate.
1. Cortex of cer	ebellum 5. Pyramids
2. Basal nuclei	6. Thalamic nuclei
3. Anterior com	misure 7. Cerebellar peduncle
4 Corpus callos	sum

20. Figure 7–5 illustrates a "see-through" brain showing the positioning of the ventricles and connecting canals or apertures. Correctly identify all structures having leader lines by using the key choices provided below. One of the lateral ventricles has already been identified. Color the spaces filled with cerebrospinal fluid blue.

Key Choices

- A. Anterior horn
- D. Fourth ventricle
- G. Lateral aperture

- B. Central canal
- E. Inferior horn
- H. Third ventricle

- C. Cerebral aqueduct
- F. Interventricular foramen

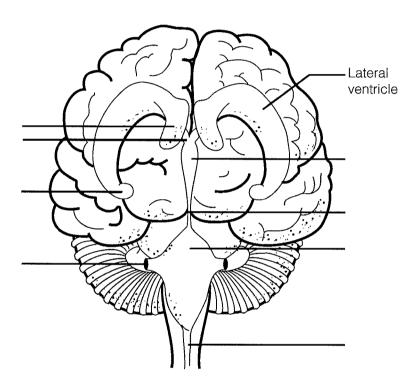

Figure 7-5

•	ne letter I in the answer blank. If a statement ed word(s) and write the correct word(s) in the
1.	The primary somatosensory area of the cerebral hemisphere(s) is found in the <u>precentral</u> gyrus.
2.	Cortical areas involved in audition are found in the occipital lobe.
3.	The primary motor area in the <u>temporal</u> lobe is involved in the initiation of voluntary movements.
4.	The specialized motor speech area is located at the base of the precentral gyrus in an area called <u>Wernicke's</u> area.
5.	The right cerebral hemisphere receives sensory input from the <u>right</u> side of the body.
6.	The <u>pyramidal</u> tract is the major descending voluntary motor tract
7.	The primary motor cortex is located in the postcentral gyrus.
8.	Centers for control of repetitious or stereotyped motor skills are found in the <u>primary motor</u> cortex.
9.	The largest parts of the motor humunculi are the lips, tongue, and <u>toes</u> .
10.	Sensations such as touch and pain are integrated in the <u>primary sensory cortex</u> .
11.	The primary visual cortex is in the <u>frontal</u> lobe of each cerebral hemisphere.
12.	In most humans, the area that controls the comprehension of language is located in the <u>left</u> cerebral hemisphere.
13.	A <u>flat</u> EEG is evidence of clinical death.
14.	Beta waves are recorded when an individual is awake

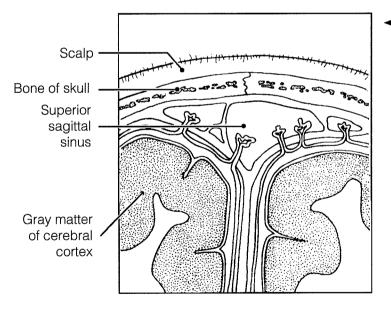

Protection of the CNS

22. Identify the meningeal (or associated) structures described here.

 1. Outermost covering of the brain, composed of tough fibrous connective tissue
2. Innermost covering of the brain; delicate and vascular
 3. Structures that return cerebrospinal fluid to the venous blood in the dural sinuses
4. Middle meningeal layer; like a cobweb in structure
5. Its outer layer forms the periosteum of the skull

23. Figure 7–6 shows a frontal view of the meninges of the brain at the level of the superior sagittal (dural) sinus. First, label the *arachnoid villi* on the figure. Then, select different colors for each of the following structures and use them to color the coding circles and corresponding structures in the diagram.

Dura materPia materArachnoid materSubarachnoid space

	2. Neuron type found in the ventral horn 3. Neuron type in a dorsal root ganglion 4. Fiber type in the ventral root 5. Fiber type in the dorsal root 6. Fiber type in a spinal nerve

28. Figure 7–7 is a cross-sectional view of the spinal cord. First identify the areas listed in the key choices by inserting the correct letters next to the appropriate leader lines on parts A and B of the figure. Then, color the bones of the vertebral column in part B gold.

Key Choices

- A. Central canal
- E. Dorsal root
- I. Ventral horn

- B. Columns of white matter
- F. Dorsal root ganglion
- J. Ventral root

- C. Conus medullaris
- G. Filum terminale
- D. Dorsal horn
- H. Spinal nerve

On part A, color the butterfly-shaped gray matter gray, and color the spinal nerves and roots yellow. Finally, select different colors to identify the following structures and use them to color the figure.

Pia mater

Dura mater

Arachnoid mater

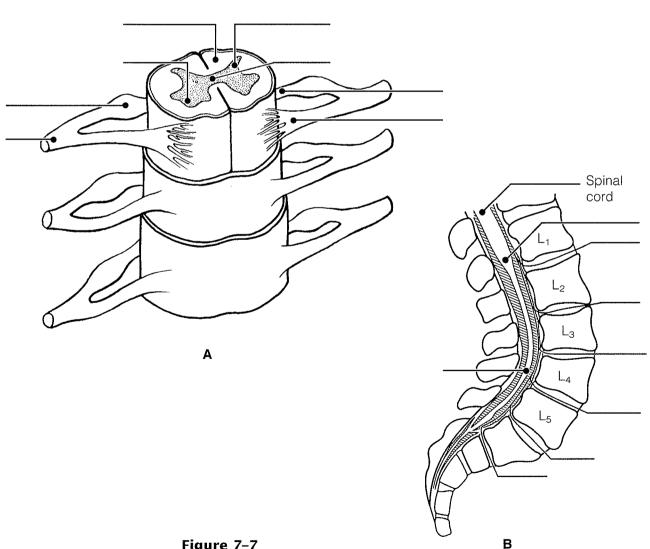

Figure 7-7

PERIPHERAL NERVOUS SYSTEM

Structure of a Nerve

29. Figure 7–8 is a diagrammatic view of a nerve wrapped in its connective tissue coverings. Select different colors to identify the following structures and use them to color the coding circles and corresponding structures in the figure. Then, label each of the sheaths indicated by leader lines on the figure.

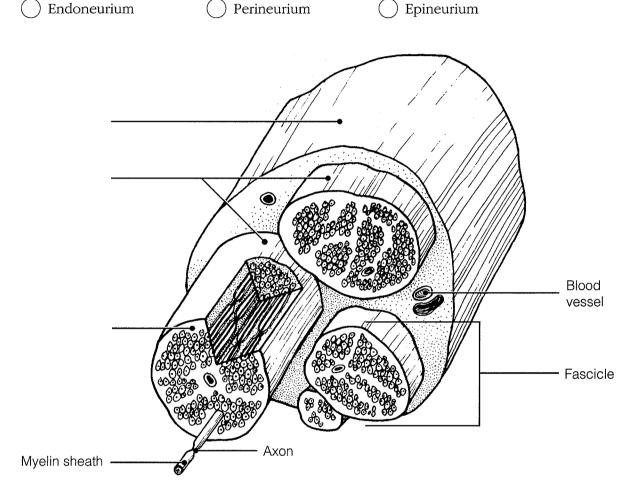

Figure 7-8

Complete the following statements by inserting your responses in the answer blanks.		
1	Another name for a bundle of nerve fibers is <u>(1)</u> . Nerves carrying both sensory and motor fibers are called <u>(2)</u>	
2	nerves, whereas those carrying just sensory fibers are referred to as sensory, or <u>(3)</u> , nerves.	
3		

Cranial Nerves

31. The 12 pairs of cranial nerves are indicated by leader lines in Figure 7–9. First, label each by name and Roman numeral on the figure and then color each nerve with a different color.

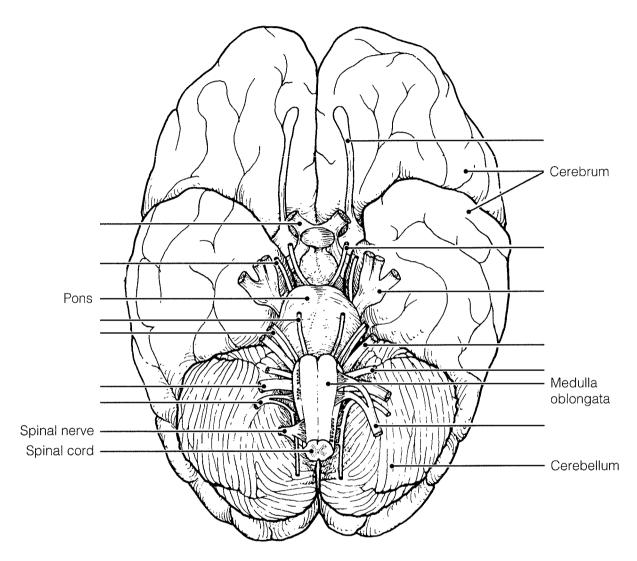

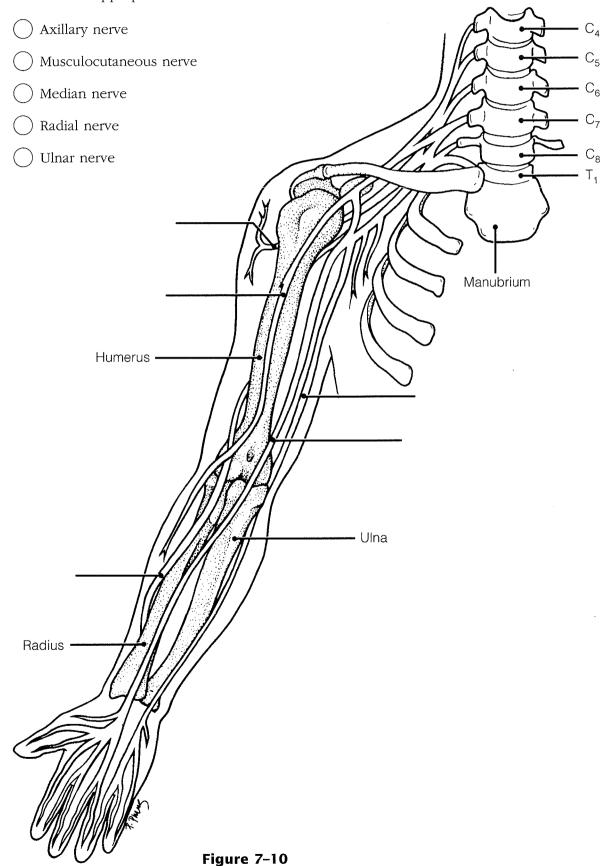

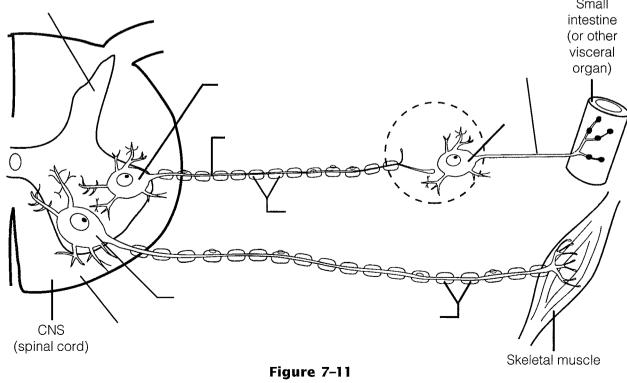

Figure 7-9

2. Smelling a flower
 3. Raising the eyelids and focusing the lens of the eye for accommodation; constriction of the eye pupils
 4. Slows the heart; increases the mobility of the digestive tract
 5. Involved in smiling
6. Involved in chewing gum
 7. Listening to music; seasickness
8. Secretion of saliva; tasting well-seasoned food
 9. Involved in "rolling" the eyes (three nerves—provide numbers only)
10. Feeling a toothache
11. Reading <i>Tennis</i> magazine or this study guide
 12. Purely sensory (three nerves—provide numbers only)

34. Figure 7–10 is an anterior view of the principal nerves arising from the brachial plexus. Select five different colors and color the coding circles and the nerves listed below. Also, label each nerve by inserting its name at the appropriate leader line.

	1. Neck and sho	oulders (plexus only)
	2. Abdominal wa	all (plexus only)
	3. Anterior thigh	
	4. Diaphragm	
	5. Posterior thigh	a
	6. Leg and foot ((2)

A Visualization Exercise for the Nervous System

You climb on the first cranial nerve you see . . .

39.	Where necessary, complete statements by inserting the missing words in the answer blanks.		
	1. Nervous tissue is quite densely packed, and it is difficult to envision strolling through its various regions. Imagine instead that each of the various functional regions of the brain has a		
	nputerized room where you can observe what occurs in that particular area. Your assignment is letermine where you are at any given time during your journey through the nervous system.		

You begin your journey after being miniaturized and injected into the warm pool of cerebrospinal fluid in your host's fourth ventricle. As you begin your stroll through the nervous tissue, you notice a huge area of branching white matter overhead. As you enter the first computer room you hear an announcement through the loudspeaker: "The pelvis is tipping too far posteriorly. Please correct. We are beginning to fall backward and will soon lose our balance." The computer responds immediately, decreasing impulses to the posterior hip muscles and increasing impulses to the anterior thigh muscles. "How is that, proprioceptor 1?" From this information, you determine that your first stop is the __(1)_.

2.
 3.
 4.
 . 5.
 6.
 7.
 8.
 9.
_10.
 _11.
 _12.

At the next computer room, you hear, "Blood pressure to head is falling; increase sympathetic nervous system stimulation of the blood vessels." Then, as it becomes apparent that your host has not only stood up but is going to run, you hear, "Increase rate of impulses to the heart and respiratory muscles. We are going to need more oxygen and a faster blood flow to the skeletal muscles of the legs." You recognize that this second stop must be the (2).

Computer room 3 presents a problem. There is no loudspeaker here. Instead, incoming messages keep flashing across the wall, giving only bits and pieces of information. "Four hours since last meal: stimulate appetite center. Slight decrease in body temperature: initiate skin vasoconstriction. Mouth dry: stimulate thirst center. Oh, a stroke on the arm: stimulate pleasure center." Looking at what has been recorded here—appetite, temperature, thirst, and pleasure—you conclude that this has to be the <u>(3)</u>.

Continuing your journey upward toward the higher brain centers, finally you are certain that you have reached the cerebral cortex. The first center you visit is quiet, like a library with millions of "encyclopedias" of facts and recordings of past

input. You conclude that this must be the area where __(4)_ are stored and that you are in the __(5)_ lobe. The next stop is close-by. As you enter the computer center, you once again hear a loudspeaker: "Let's have the motor instructions to say 'tintinnabulation.' Hurry, we don't want them to think we're tongue-tied." This area is obviously __(6)__. Your final stop in the cerebral cortex is a very hectic center. Electrical impulses are traveling back and forth between giant neurons, sometimes in different directions and sometimes back and forth between a small number of neurons. Watching intently, you try to make some sense out of these interactions and suddenly realize that this *is* what is happening here. The neurons *are* trying to make some sense out of something, and this helps you decide that this must be the brain area where __(7)_ occurs in the __(8)_ lobe.

You hurry out of this center and retrace your steps back to the cerebrospinal fluid, deciding en route to observe a cranial nerve. You decide to pick one randomly and follow it to the organ it serves. You climb on to the first cranial nerve you see and slide down past the throat. Picking up speed, you quickly pass the heart and lungs and see the stomach and small intestine coming up fast. A moment later you land on the stomach and now you know that this wandering nerve has to be the __(9)__. As you look upward, you see that the nerve is traveling almost straight up and that you'll have to find an alternative route back to the cerebrospinal fluid. You begin to walk posteriorly until you find a spinal nerve, which you follow until you reach the vertebral column. You squeeze between two adjacent vertebrae to follow the nerve to the spinal cord. With your pocket knife you cut away the tough connective tissue covering the cord. Thinking that the __(10)__ covering deserves its name, you finally manage to cut an opening large enough to get through, and you return to the warm bath of cerebrospinal fluid that it encloses. At this point you are in the __(11)__, and from here you swim upward until you get to the lower brain stem. Once there, it should be an easy task to find the holes leading into the __(12)__ ventricle, where your journey began.

40. After surgery, patients are often temporarily unable to urinate, and bowel sounds are absent. Identify the division of the autonomic nervous system that is affected by anesthesia.

41. A brain tumor is found in a CT scan of Mr. Childs's head. The physician is assuming that it is not a secondary tumor (i.e., it did not spread from another part of the body) because an exhaustive workup has revealed no signs of cancer elsewhere in Mr. Childs's body. Is the brain tumor more likely to have developed from nerve tissue or from neuroglia? Why?

42. Amy, a high-strung teenager, was suddenly startled by a loud bang that sounded like a gunshot. Her heartbeat accelerated rapidly. When she realized that the noise was only a car backfiring, she felt greatly relieved but her heart kept beating heavily for several minutes more. Why does it take a long time to calm down after we are scared?

43. You have been told that the superior and medial part of the right precentral gyrus of your patient's brain has been destroyed by a stroke. What part of the body is the patient unable to move? On which side, right or left?

44.	nee See	Application of knowledge: You have been given all of the information needed to identify the brain regions involved in the following situations. See how well your nervous system has integrated this information, and name the brain region (or condition) most likely to be involved in each situation. Place your responses in the answer blanks.				
	1.	Following a train accident, a man with an obvious head injury was observed stumbling about the scene. An inability to walk properly and a loss of balance were quite obvious. What brain region was injured?				
	2.	An elderly woman is admitted to the hospital to have a gallbladder operation. While she is being cared for, the nurse notices that she has trouble initiating movement and has a strange "pill-rolling" tremor of her hands. What cerebral area is most likely involved?				
	3.	A child is brought to the hospital with a high temperature. The doctor states that the child's meninges are inflamed. What name is given to this condition?				
	4.	A young woman is brought into the emergency room with extremely dilated pupils. Her friends state that she has overdosed on cocaine. What cranial nerve is stimulated by the drug?				
	5.	A young man has just received serious burns, resulting from standing with his back too close to a bonfire. He is muttering that he never felt the pain. Otherwise, he would have smothered the flames by rolling on the ground. What part of his CNS might be malfunctioning?				
	6.	An elderly gentleman has just suffered a stroke. He is able to understand verbal and written language, but when he tries to respond, his words are garbled. What cortical region has been damaged by the stroke?				
	7.	A 12-year-old boy suddenly falls to the ground, having an epileptic seizure. He is rushed to the emergency room of the local hospital for medication. His follow-up care includes a recording of his brain waves to try to determine the area of the lesion. What is this procedure called?				

45. Marie Nolin exhibits slow, tentative movements and a very unstable gait. Examination reveals she cannot touch her finger to her nose with eyes closed. What is the name of this condition and what part of her brain is damaged?

46. Which would be the more likely result of injury to the posterior side of the spinal cord only—paralysis or paresthesia (loss of sensory input)? Explain your answer.

47. While jogging in Riverside Park, Susan was confronted by an angry dog. What division of her ANS was activated as she turned tail and ran from the dog?

48. During action potential transmission, many ions cross the neuronal membrane at right angles to the membrane. What is it that travels *along* the membrane and acts as the signal?

THE FINALE: MULTIPLE CHOICE

- 49. Select the best answer or answers from the choices given.
 - 1. Bipolar neurons:
 - A. are found in the head
 - B. are always part of an afferent pathway
 - C. have two dendrites
 - D. have two axons
 - 2. Which of the following skin cells would form a junction with a motor neuron?
 - A. Keratinocyte
 - B. Sudoriferous glandular epithelial cell
 - C. Arrector pili muscle cell
 - D. Fibroblast
 - 3. A synapse between an axon terminal and a neuron cell body is called:
 - A. axodendritic
 - B. axoaxonic
 - C. axosomatic
 - D. axoneuronic
 - 4. Which is an incorrect association of brain region and ventricle?
 - A. Mesencephalon—third ventricle
 - B. Cerebral hemispheres—lateral ventricles
 - C. Pons—fourth ventricle
 - D. Medulla—fourth ventricle
 - 5. The pineal gland is located in the:
 - A. hypophysis cerebri
 - B. mesencephalon
 - C. epithalamus
 - D. corpus callosum

- 6. Which of the following is not part of the brain stem?
 - A. Medulla

C. Pons

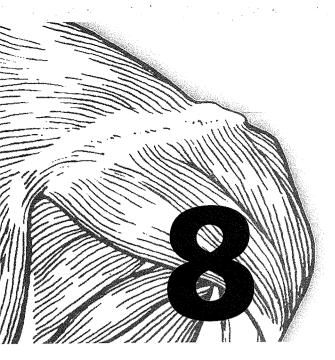

B. Cerebellum

D. Midbrain

- 7. When neurons in Wernicke's area send impulses to neurons in Broca's area, the white matter tracts utilized are:
 - A. commissural fibers
 - B. projection fibers
 - C. association fibers
 - D. anterior funiculus
- 8. Functions that are at least partially overseen by the medulla are:
 - A. regulation of the heart
 - B. maintaining equilibrium
 - C. regulation of respiration
 - D. visceral motor function
- 9. Which structures are directly involved with formation, circulation, and drainage of CSF?
 - A. Ependymal cilia
 - B. Ventricular choroid plexuses
 - C. Arachnoid villi
 - D. Serous layers of the dura mater
- 10. In an earthquake, which type of sensory receptor is most likely to sound the *first* alarm?
 - A. Exteroceptor
- C. Mechanoreceptor
- B. Visceroceptor
- D. Proprioceptor

SPECIAL SENSES

The body's sensory receptors react to stimuli or changes occurring both within the body and in the external environment. When triggered, these receptors send nerve impulses along afferent pathways to the brain for interpretation, thus allowing the body to assess and adjust to changing conditions so that homeostasis may be maintained.

The minute receptors of general sensation that react to touch—pressure, pain, temperature changes, and muscle tension—are widely distributed in the body. These are considered in Chapter 7. In contrast, receptors of the special senses—sight, hearing, equilibrium, smell, and taste—tend to be localized and in many cases are quite complex. The structure and function of the special sense organs are the subjects of the student activities in this chapter.

THE EYE AND VISION

1.	Complete the following statem answer blanks.	ents by inserting your responses in the
	1	Attached to the eyes are the(1) muscles that allow us to direct our eyes toward a moving object. The anterior aspect of each eye is protected by the(2), which have eyelashes projecting from their edges. Closely associated with the lashe are oil-secreting glands called(3) that help to lubricate the eyes. Inflammation of the mucosa lining the eyelids and covering the anterior part of the eyeball is called(4)
2.	Trace the pathway that the sec surface of the eye by assigning will be <i>closest</i> to the lacrimal g	retion of the lacrimal glands takes from the g a number to each structure. (Note that #1 cland.)
	1. Lacrimal sac	3. Nasolacrimal duct
	2. Nasal cavity	4. Lacrimal canals

3. Identify each of the eye muscles indicated by leader lines in Figure 8–1. Color code and color each muscle a different color. Then, in the blanks below, indicate the eye movement caused by each muscle.

\bigcirc	1. Superior rectus	4. Lateral rectus
\bigcirc	2. Inferior rectus	5. Medial rectus
\bigcirc	3. Superior oblique	6. Inferior oblique

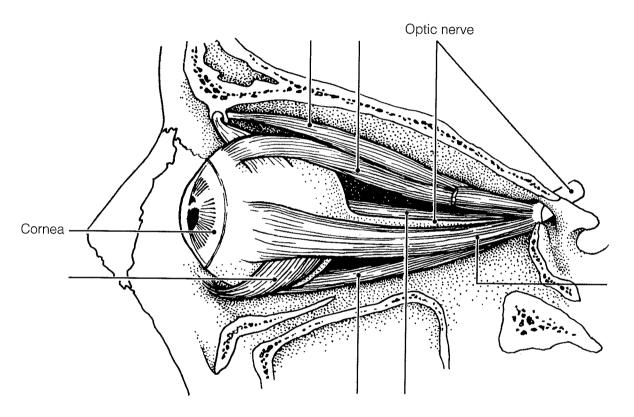

Figure 8-1

4. Three main accessory eye structures contribute to the formation of tears and/or aid in lubricating the eyeball. In the table, name each structure and then name its major secretory product. Indicate which of the secretions has antibacterial properties by circling that response.

Acce	sso	ry	eye	stru	ctures
------	-----	----	-----	------	--------

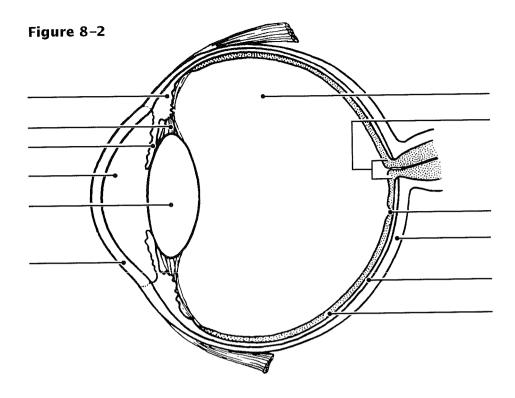

Secretory product

1.	
2.	
3.	

5. Match the terms provided in Column B with the appropriate descriptions in Column A. Insert the correct letter response or corresponding term in the answer blanks. Column B Column A A. Accommodation 1. Light bending B. Accommodation 2. Ability to focus for close vision pupillary reflex (under 20 feet) C. Astigmatism 3. Normal vision 4. Inability to focus well on close objects; D. Cataract farsightedness E. Convergence 5. Reflex constriction of pupils when they F. Emmetropia are exposed to bright light G. Glaucoma 6. Clouding of the lens, resulting in loss of sight H. Hyperopia ___ 7. Nearsightedness I. Myopia 8. Blurred vision, resulting from unequal J. Night blindness curvatures of the lens or cornea K. Photopupillary 9. Condition of increasing pressure inside reflex the eye, resulting from blocked drainage of aqueous humor L. Refraction 10. Medial movement of the eyes during focusing on close objects 11. Reflex constriction of the pupils when viewing close objects __ 12. Inability to see well in the dark; often a result of vitamin A deficiency 6. The intrinsic eye muscles are under the control of which division of the nervous system? Circle the correct response. 2. Somatic nervous system 1. Autonomic nervous system 7. Complete the following statements by inserting your responses in the answer blanks. A (1) lens, like that of the eye, produces an image that is upside down and reversed from left to right. Such an image is called a (2) image. In farsightedness, the light is focused (3) the retina. The lens used to treat farsightedness is a (4) lens. In nearsightedness, the light is focused (5) the retina; it is corrected with a (6) lens.

8. Using the key choices, identify the parts of the eye described in the following statements. Insert the correct term or letter response in the answer blanks. Key Choices Aqueous humor F. Cornea Retina B. Canal of Schlemm G. Fovea centralis Sclera C. Choroid H. Iris Vitreous humor D. Ciliary body I. Lens E. Ciliary zonule Ţ. Optic disk 1. Attaches the lens to the ciliary body 2. Fluid in the anterior segment that provides nutrients to the lens and cornea ______ 3. The "white" of the eye 4. Area of retina that lacks photoreceptors 5. Contains muscle that controls the shape of the lens ______6. Nutritive (vascular) layer of the eye 7. Drains the aqueous humor of the eye ______ 8. Layer containing the rods and cones 9. Gel-like substance that helps to reinforce the eyeball 10. Heavily pigmented layer that prevents light scattering within the eye 12. Smooth muscle structures (intrinsic eye muscles) _____13. Area of acute or discriminatory vision ______14. ______15. Refractory media of the eye (#14–17) ______16. ______17. _____18. Most anterior part of the sclera—your "window on the world" _____19. Pigmented "diaphragm" of the eye

9. Using the key choice terms given in Exercise 8, identify the structures indicated by leader lines on the diagram of the eye in Figure 8–2. Select different colors for all structures provided with a color-coding circle in Exercise 8, and then use them to color the coding circles and corresponding structures in the figure.

10. In the following table, circle the correct word under the vertical headings that describes events occurring within the eye during close and distant vision.

Vision	Ciliary	y muscle	Lens convexity		Degree of light refraction		
1. Distant	Relaxed	Contracted	Increased	Decreased	Increased	Decreased	
2. Close	Relaxed	Contracted	Increased	Decreased	Increased	Decreased	

11 .	Name in sequence the neura the retina and ending with the	l elements of the visual pathway, beginning with ne optic cortex.
	Retina ——	
	Synapse in thalamus ——	→ Optic cortex
12.	Complete the following state answer blanks.	ments by inserting your responses in the
	1.	There are <u>(1)</u> varieties of cones. One type responds most vigorously to <u>(2)</u> light, another to <u>(3)</u> light, and still
	2.	another to <u>(4)</u> light. The ability to see intermediate colors such as purple results from the fact that more than one cone
	3.	type is being stimulated <u>(5)</u> . Lack of all color receptors results in <u>(6)</u> . Because this condition is sex linked, it occurs
	4.	more commonly in $\underline{(7)}$. Black and white, or dim light, vision is a function of the $\underline{(8)}$.
	5.	

13.	13. Circle the term that does not belong in each of the following groupings.									
	1.	Choroid	Sclei	ra	Vitreous hui	nor	R	etina		
	2.	Ciliary body]	Iris	Superior re	ectus	(Choroid		
	3.	Pupil constriction	on	Far vi	sion	Acco	mmodati	on	Brig	ht light

		_ 7 8.		9. Collect	tively called	the os	ssicles			
		10 11	. Ear st	ructures no	ot involved v	vith h	earing			

 12.	Allows pressure in the middle ear to be equalized with the atmospheric pressure
 13.	Vibrates as sound waves hit it; transmits the vibrations to the ossicles
 14.	Contains the organ of Corti
 15.	Connects the nasopharynx and the middle ear
 16.	17. Contain receptors for the sense of equilibrium
 18.	Transmits the vibrations from the stirrup to the fluid in the inner ear
 19.	Fluid that bathes the sensory receptors of the inner ear
 20.	Fluid contained within the osseous labyrinth, which bathes the membranous labyrinth

16. Figure 8–3 is a diagram of the ear. Use anatomical terms (as needed) from the key choices in Exercise 15 to correctly identify all structures in the figure provided with leader lines. Color all external ear structures yellow; color the ossicles red; color the equilibrium areas of the inner ear green; and color the internal ear structures involved with hearing blue.

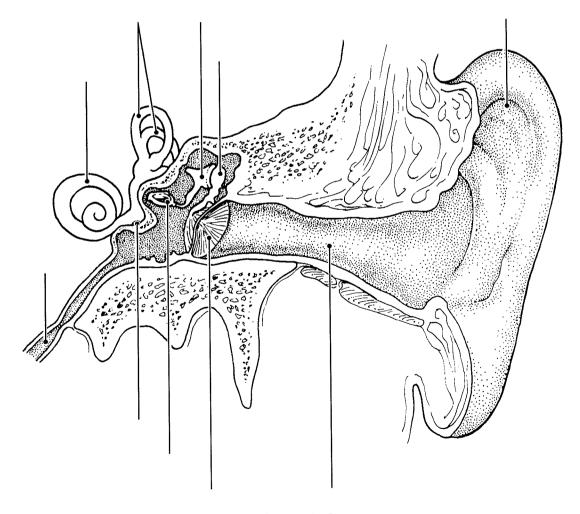

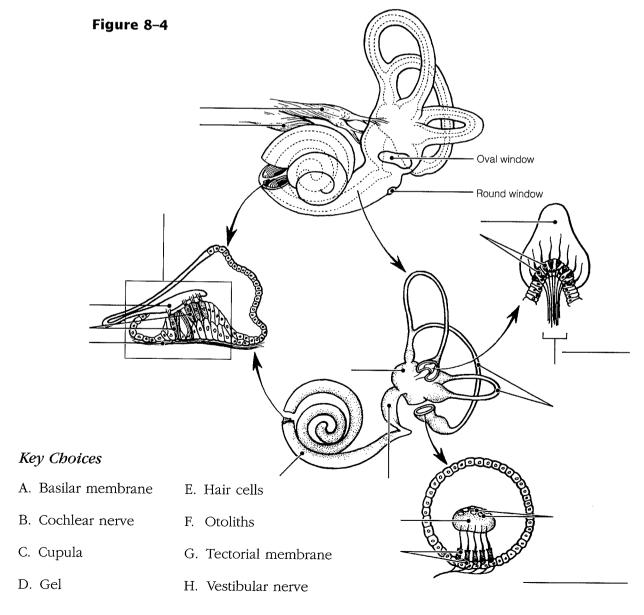

Figure 8-3

17. Sound waves hitting the eardrum set it into vibration. Trace the pathway through which vibrations and fluid currents travel to finally stimulate the hair cells in the organ of Corti. Name the appropriate ear structures in their correct sequence and insert your responses in the answer blanks.

Eardrum			-	_
		Oval window	·	
			——► Hair cel	le

18. Figure 8–4 is a view of the structures of the membranous labyrinth. Correctly identify the following major areas of the labyrinth on the figure: *membranous semicircular canals*, *saccule* and *utricle*, and the *cochlear duct*. Next, correctly identify each of the receptor types shown in enlarged views (organ of Corti, crista ampullaris, and macula). Finally, using terms from the key choices below, identify all receptor structures provided with leader lines. (Some of these terms may need to be used more than once.)

19. Complete the following statements on the functioning of the static and dynamic equilibrium receptors by inserting the letter or term from the key choices in the answer blanks.

Key Choices

	A. Angular/rotatory	E.	Gravity	I.	Semicircular canals
	B. Cupula	F.	Perilymph	J.	Static
	C. Dynamic	G	. Proprioception	K.	Utricle
	D. Endolymph	Н	. Saccule	L.	Vision
